Wisconsin Department of Health and Family Services*

Foreword

The Department of Health and Family Services is mandated by section 69.03 (9), Wisconsin Statutes, to prepare an annual report on vital statistics. This report summarizes data collected from the confidential portion of the birth record and related infant death information compiled from resident death certificates.

The Department of Health and Family Services produced this publication, which was prepared in the Bureau of Health Information and Policy, Division of Public Health.

In the Bureau of Health Information and Policy, staff of the Vital Records Section, Registration and Statistics Unit, collected and compiled the birth, infant death, and fetal death records. Laura Ninneman prepared the report and updated the narrative. Patricia Namez edited the report. Draft review and comments were provided by Murray Katcher, M.D., Bureau of Community Health Promotion, Division of Public Health. The report was prepared under the supervision of John Kiesow, State Registrar, Vital Records Section, and Jane Kraus, Supervisor, Registration and Statistics Unit; and the overall direction of Patricia Guhleman, Director, Bureau of Health Information and Policy.

Additional health-related statistical information for Wisconsin is available through the Internet on the Department of Health and Family Services Web site, at <http://dhfs.wisconsin.gov/stats>. Wisconsin Interactive Statistics on Health (WISH) is a data query system that allows users to obtain birth and other data tailored to their specifications, at <http://dhfs.wisconsin.gov/wish>. Trend tables of maternal and child health data for individual counties are available at <http://dhfs.wisconsin.gov/localdata/infantspgwomn/start.htm>.

Comments, suggestions and requests for further information may be addressed to:

Introduction

This report presents information about births that occurred in 2006 to Wisconsin residents. Information from previous years is also presented to show changes over time. Information is included on the number and rate of live births; demographic characteristics of the mother, such as age, race/ethnicity, marital status, education and number of previous births; characteristics of the pregnancy and delivery, including the trimester that prenatal care began, number of visits, and whether the mother smoked during pregnancy; and characteristics of the newborn. Also included is information about infants who died before their first birthday, and fetuses of more than 20 weeks of gestation who were stillborn.

All data in this report refer to Wisconsin residents unless otherwise noted. In most tables, events have been assigned to the place where the person lives (usually legal residence), regardless of the place of the event. For births, the reference is to the residence of the mother. For deaths, the reference is to the residence of the infant.

The indicators included in this report have been selected based on their availability from birth and infant death records and their use in identifying health risks, as determined by national and international studies. The data files used are the Wisconsin resident birth certificate file, the matched birth-death file, and the fetal death file. The tables and graphics presented were designed to make these indicators easily accessible, while allowing users flexibility. Most tables include the frequencies of events or conditions, along with percentages or rates. In general, bar graphs show data for 2006 (and comparative information for 1996); line graphs show time trends, and vary in the years shown for comparison.

This year's report includes two additions. Table 1-7 (p. 27) shows the percent of births at low birthweight and very low birthweight for African American and white births, and the black/white disparity ratios; and Table 1-9 (p. 32) shows infant mortality rates by race/ethnicity and mother's age.

This year a change was made to the way birth rates at the youngest and oldest maternal ages are calculated. For teen birth rates (15-19 and 15-17), mothers younger than 15 are excluded from the numerator. For birth rates to women aged 40-44, mothers older than 44 are excluded from the numerator. This change was made to make the rates comparable to national statistics. Table 1-1, Figure 2, Figure 4, and Table 3-2 were affected by this change.

Chapter 69 of the Wisconsin Statutes mandates the Department of Health and Family Services to supervise and direct the collection of birth data from hospitals and birth attendants. State law also requires the Department to protect the confidentiality of birth data, and to ensure that statistical information based on the data (such as that contained in this report) does not identify any individual. The Bureau of Health Information and Policy in the Department of Health and Family Services scrupulously follows written procedures to protect the confidential data entrusted to it.

The National Center for Health Statistics works with representatives of all 50 states to select the specific data items collected on the birth record. Data items are chosen for their usefulness in understanding and improving maternal and child health outcomes.

The Bureau of Health Information and Policy acknowledges and thanks the Wisconsin hospitals and birth attendants who reported birth information, and their counterparts in neighboring states who submitted out-of-state birth data for Wisconsin residents.

Key Findings

- In 2006, there were 72,302 live births to Wisconsin residents, 1,368 more than in 2005.
- The 2006 crude birth rate in Wisconsin was 12.9 births per 1,000 total population, a slight increase from 2005 (12.7). In comparison, the United States crude birth rate for 2004 was 14.0 per 1,000 population. (The crude birth rate is the number of live births per 1,000 total population.)
- The 2006 general fertility rate of 63.4 births per 1,000 Wisconsin females aged 15-44 was lower than the 2004 United States general fertility rate of 66.3 births per 1,000 (see Technical Notes, page 107, for source of U.S. data).
- In 2006, the fertility rate for Wisconsin teens aged 15-19 was 30.6 births per 1,000 females in this age group. This was a slight increase from the 2005 rate (30.1). In 2004, the U.S. teen fertility rate was 41.1.
- Wisconsin age-specific fertility rates are lower than the corresponding national rates for teens, women aged 20-24 and women aged 35 and older. Age-specific fertility rates for women aged 25-29 and 30-34 are higher than corresponding national rates (see page 5 of this report).
- From 1996 to 2006, the percent of births to women in their teens and early thirties decreased, while the percent of births to women in their twenties and aged 35-39 increased. The proportion of births to women aged 40 and older remained the same.
- From 1996 to 2006, the proportion of Wisconsin births to non-Hispanic white women decreased from 82 percent to 75 percent, while the proportion of births to Hispanics/Latinos increased from 5 percent to 10 percent. The proportion of births to women in other race/ethnicity groups remained roughly stable, with black/African American women accounting for 10 percent in both 1996 and 2006, American Indian women approximately 1 percent each year, and women in other groups approximately 3 to 4 percent each year.
- In 2006, 15 percent of Wisconsin women who gave birth had not finished high school, down from 16 percent in 1996. Fifty-six percent of women who gave birth in 2006 had attended college for one year or more, compared to 51 percent in 1996.
- The overall proportion of women who received first-trimester prenatal care was 84 percent in 2006, the same as the percent in 1996. The proportion with first-trimester care increased for mothers aged less than 15, 18-19, 20-24, and 40 and older; and in all race/ethnicity groups except whites.
- The proportion of women giving birth who reported they smoked during pregnancy decreased from 18 percent in 1996 to 15 percent in 2006.
- In 2006, 4,994 Wisconsin infants were low birthweight; that is, they weighed less than 2,500 grams (about 5.5 pounds) at birth. This total represented 6.9 percent of all births, compared to 7.0 percent in 2005. In comparison, 8.1 percent of all infants born in the United States in 2004 weighed less than 2,500 grams.
- Among low birthweight infants, 914 (1.3 percent of all births) were born at *very* low birthweight (less than 1,500 grams or about 3.3 pounds) and were thus at the highest risk for

health problems. The very low birthweight percentage was 1.0 percent of births to whites, 3.0 percent of births to blacks/African Americans, 1.7 percent of births to American Indians, 1.3 percent of births to Hispanics/Latinos and 1.1 percent of births to Laotian/Hmong.

- In 2006, 8,104 Wisconsin infants were born prematurely (with a gestation of less than 37 weeks). This total represented 11.2 percent of all births (compared to 11.3% in 2005). (See Technical Notes, page 108, for full definition of prematurity.)
- In Wisconsin, 462 infants under the age of one year died in 2006. The 2006 infant mortality rate was 6.4 infant deaths per 1,000 live births, compared to 6.6 in 2005 and 7.3 in 1996. The 2004 U.S. infant mortality rate (the latest available) was 6.8 infant deaths per 1,000 live births.
- The black/African American infant mortality rate for 2006 was 17.2 deaths per 1,000 births to black/African American mothers, compared to 15.0 in 2005 and 18.3 in 1996. The 2006 white infant mortality rate was 4.9 deaths per 1,000 births to white women, compared to 5.6 in 2005 and 5.9 in 1996. The Hispanic/Latino infant mortality rate for 2006 was 6.3 deaths per 1,000 births to Hispanic/Latino women, compared to 6.7 in 2005 and 10.2 in 1996.
- Based on three-year rolling average infant mortality rates (Figure 22), American Indian infant mortality has dropped markedly since 1984. The rate was 19.6 per 1,000 live births in 1984-1986 and 8.1 per 1,000 in 2004-2006. The African American infant mortality rate has remained much higher than the rate for other populations in Wisconsin for at least two decades. The three-year average rate was 18.4 per 1,000 live births in 1984-1986, and 17.2 in 2004-2006. The Hispanic/Latino infant mortality rate fluctuated but remained essentially unchanged; it was 6.4 per 1,000 live births in 1984-1986 and 6.0 per 1,000 in 2004-2006. Total infant mortality and white infant mortality declined gradually over the 1984-2006 period.
- The black-white disparity ratio for infant mortality has increased over the past 15 years. The black/African American infant mortality rate was 2.2 times the white rate in 1990-1992, and 3.4 times the white rate in 2004-2006 (Figure 23).

Ten Most Popular First Names for Newborns, Wisconsin 2006		
Females		Males
1. Ava		1. Ethan
2. Emma		2. Jacob
3. Emily		3. Logan
4. Olivia		4. Mason
5. Isabella		5. Noah
6. Abigail		6. Alexander
7. Hannah		7. Benjamin
8. Grace		8. Tyler
9. Elizabeth		9. Owen
10. Ella		10. Michael

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: This ranking counts each spelling as a separate name. The list would change somewhat if different spellings were grouped together and counted as one name. For example, counting Kaitlyn, Katelyn, Caitlin, Caitlyn and Kaitlin as one name could change the placements.

Birth and Fertility Rates

- In 2006 there were 72,302 births to Wisconsin residents, 1,368 more than in 2005 (Figure 1).
- The 2006 crude birth rate was 12.9 births per 1,000 population (Table 2-1), slightly higher than the 2005 rate (12.7). In comparison, the United States crude birth rate for 2004 was 14.0 births per 1,000 population. (The crude birth rate is the number of live births per 1,000 total population.)
- The 2006 general fertility rate of 63.4 births per 1,000 Wisconsin females ages 15-44 (Table 2-1) was higher than the 2005 rate (61.2). In comparison, the United States general fertility rate for 2004 was 66.3 births per 1,000.

Figure 1. Number of Births to Wisconsin Residents, 1910-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: A live birth is the complete expulsion or extraction from his or her mother of a human being, at any stage of development, who, after the expulsion or extraction, breathes or has a beating heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, regardless of whether the umbilical cord has been cut, and regardless of whether the expulsion or extraction occurs as a result of a natural or induced labor, a cesarean section, or an abortion. Unless otherwise noted, all births referred to in this report are live births to Wisconsin residents.

- Wisconsin age-specific fertility rates are lower than the corresponding national rates for teens, women aged 20-24 and women aged 35 and older (Table 1-1). Age-specific fertility rates are the number of births to a specific age group per 1,000 females in that age group.
- Fertility rates among Wisconsin women aged 25-29 and 30-34 are higher than the corresponding national rates, based on United States 2004 final statistics (Table 1-1). (See Technical Notes, page 107, for source of U.S. data.)

Table 1-1. Age-Specific Fertility Rates, Wisconsin, 2006 and United States, 2004

Age	Wisconsin Rate	U.S. Rate
10-14	0.5	0.7
15-19	30.6	41.1
15-17	15.6	22.1
18-19	53.1	70.0
20-24	86.5	101.7
25-29	126.9	115.5
30-34	101.1	95.3
35-39	43.6	45.4
40-44	7.5	8.9
45-49	0.4	0.5

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Rates are the number of births per 1,000 females in the age group. See Technical Notes (page 107) for an explanation of birth rate calculations.

- Compared with 1990 (Figure 2), age-specific fertility rates in 2006 were:
 - Lower for teens and women aged 20-24.
 - Higher for women aged 25-plus.

Figure 2. Age-Specific Fertility Rates, Wisconsin, 1990-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Rates are the number of births per 1,000 females in the age group. See Technical Notes (page 107) for an explanation of birth rate calculations.

- Race/ethnicity-specific birth rates (births per 1,000 females aged 15-44 in a race/ethnicity group) have decreased since 1990 for non-Hispanic whites, African Americans, and Asians.
- The overall birth rate (also called the general fertility rate) also decreased, from 64.5 to 63.4 per 1,000 females aged 15-44.
- The African American and Asian birth rates decreased most dramatically. The African American rate decreased from 110.5 births per 1,000 African American females aged 15-44 in 1990 to 82.0 per 1,000 in 2006, a decline of 26 percent. The Asian birth rate decreased 28 percent, from 119.7 to 86.7 per 1,000 Asian females aged 15-44.
- The white birth rate decreased from 60.2 to 57.4 per 1,000 white females aged 15-44.
- The American Indian birth rate stayed fairly stable during the 1990s, then began gradually increasing. In 2006, the rate was 95.2 per 1,000 American Indian females aged 15-44 (85.7 in 1990).
- In contrast to trends in most other groups, the Hispanic/Latino birth rate has steadily increased since 1990. In 2006, the Hispanic/Latino birth rate was 111.8 per 1,000 Hispanic/Latino females aged 15-44 (85.1 in 1990).

Figure 3. Birth Rates by Race/Ethnicity, 1990-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories. Birth rates for Wisconsin females by race are based on bridged race estimates from the US Census Bureau. Because individuals could report more than one race for the first time during the 2000 Census, rates for earlier years are not directly comparable to those for 2000 and later.

Population estimates, especially in relatively small and fast-growing populations, become less reliable with every year that passes after the Census on which they are based. This can affect the reliability of rates for some populations. Rates by race/ethnicity in the latter half of the decade should thus be viewed with caution.

These rates may not match previously published rates due to updates in the population estimates by race/ethnicity.

- In 2006, the fertility rate for Wisconsin teens aged 15-19 was 30.6 births per 1,000 females in this age group (Figure 2). The rate in 2005 was 30.1. This is the first increase in the teen fertility rate since 1999. Over the last decade, there has been a general decline in the teen fertility rate.
- For many years the Wisconsin teen fertility rate has been lower than the comparable national rate. In 2004, the U.S. teen fertility rate was 41.1.

Figure 4. Teen Birth Rates, Wisconsin, 1990-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Fertility rates are the number of births per 1,000 females in the age group. See Technical Notes (page 107) for an explanation of birth rate calculations.

Characteristics of the Mother

Age of Mother

Births in 2006 included:

- 92 births to teens less than 15 years old
- 1,840 births to teens 15-17 years old
- 4,168 births to teens 18-19 years old
- 17,163 births to women aged 20-24
- 22,235 births to women aged 25-29
- 16,886 births to women aged 30-34
- 8,200 births to women aged 35-39
- 1,611 births to women aged 40-44
- 91 births to women aged 45 or older
- 16 births with unreported maternal age.

- From 1996 to 2006, the percent of births to women in their teens and early thirties decreased, while the percent of births to women in their twenties and late thirties increased. The proportion of births to women aged 40-plus remained the same (Figure 5).

Figure 5. Percent of Births by Age of Mother, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: For detailed information on 2006 births by age of mother, see Tables 4-1 and 4-2, pages 92 and 93.

Births to Teens

- The majority of births to teens (under 20 years of age) were to older teens, aged 18-19. This was also true in 1996 (Table 1-2).

Table 1-2. Teen Births by Age, Wisconsin, 1996 and 2006

Maternal Age (Teens)	1996		2006	
	Number	Percent	Number	Percent
<15	143	2%	92	2%
15-17	2,509	35	1,840	30
18-19	4,454	63	4,168	68
Total <20	7,106	100%	6,100	100%

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Percents may not add to 100 due to rounding.

- Non-Hispanic whites make up the largest number of teen births in the state (3,139 in 2006) (Table 1-3).
- Teen births represented 8.4 percent of all births, and a higher proportion of births to blacks/African Americans, American Indians, Hispanics/Latinos, and Laotian/Hmong (Table 1-3).

Table 1-3. Teen Births by Race/Ethnicity, Wisconsin, 2006

Race/Ethnicity	Number of Births		Percent of Births		
	Total	Teens (<20)	Teens (<20)	Ages 20+	Total
Total	72,302	6,100	8.4%	91.6%	100.0%
White	54,525	3,139	5.8	94.2	100.0
Black/African American	7,020	1,540	21.9	78.1	100.0
American Indian	1,146	181	15.8	84.2	100.0
Hispanic/Latino	6,861	967	14.1	85.9	100.0
Laotian/Hmong	1,239	204	16.5	83.5	100.0
Other Asian	1,484	66	4.4	95.6	100.0

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Included in the total are 27 births for which race/ethnicity of mother was not reported; 3 of these were to mothers under 20 years of age. See Technical Notes (page 107) for definition of race/ethnicity categories.

- In 2006 compared to 1996, teen births represented a smaller proportion of births in all race/ethnicity groups. The largest decline in the teen birth percentage occurred among Hispanics/Latinos: teen births made up 14 percent of Hispanic/Latino births in 2006, compared to 22 percent in 1996 (Figure 6).

Figure 6. Teen Births as a Percent of Total Births in Each Race/Ethnicity Group, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories.

- In 2006, 10 percent of teen births occurred less than 24 months since a previous birth. Seven percent of teen births occurred 24 or more months since a previous birth, and 81 percent were first births (Table 1-4).

Table 1-4. Teen Births by Interval in Months Since Last Live Birth, Wisconsin, 2006

Birth Interval	All Ages	All Teens (<20)			All Ages	All Teens (<20)		
		<18	18-19			<18	18-19	
Total	72,302	6,100	1,932	4,168	100.0%	100.0%	100.0%	100.0%
First Birth	28,363	4,958	1,732	3,226	39.2	81.3	89.6	77.4
1-11 Months	684	81	16	65	0.9	1.3	0.8	1.6
12-17 Months	3,917	307	71	236	5.4	5.0	3.7	5.7
18-23 Months	6,167	224	43	181	8.5	3.7	2.2	4.3

Unknown	1,819	44	10	34	2.5	0.7	0.5	0.8
Plural Delivery	1,148	59	21	38	1.6	1.0	1.1	0.9

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Included in the total for all ages are 16 births for which age of mother was not reported. The “plural delivery” row includes those births in each multiple birth that are second or later birth position. For example, in a twin delivery, the first-born twin is included in the birth interval distribution (months since last live birth) and the second-born twin is included in the “plural delivery” row.

Race/Ethnicity of Mother

- In 2006, 54,525 births (75.4%) were to non-Hispanic white women (Table 1-5). This percentage has gradually declined in recent decades (it was 81.8% in 1996).
- 7,020 births (9.7%) were to non-Hispanic black/African American women (Table 1-5). The percent of births to black/African American women has been fairly stable since 1996.
- 1,146 births (1.6%) were to American Indian women (Table 1-5). This proportion has been stable for the past decade.
- 6,861 births (9.5%) were to Hispanic/Latino women (Table 1-5). This is double the proportion of Hispanic/Latino births in 1996 (4.7%).
- 1,239 births (1.7%) were to Laotian/Hmong women, similar to the 1996 percentage (1.5%).
- An additional 1,484 births (2.1%) were to women in other Asian groups (such as Chinese, Japanese, and Korean.)

Table 1-5. Number and Percent of Births by Race/Ethnicity, Wisconsin, 1996 and 2006

	1996		2006	
	Number	Percent	Number	Percent
Total	67,150	100.0%	72,302	100.0%
White	54,915	81.8	54,525	75.4
Black/African American	6,380	9.5	7,020	9.7
American Indian	812	1.2	1,146	1.6
Hispanic/Latino	3,138	4.7	6,861	9.5
Laotian/Hmong	1,031	1.5	1,239	1.7
Other Asian	855	1.3	1,484	2.1
Unknown	19	0.0	27	0.0

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The “other Asian” category includes all Asian groups other than Laotian/Hmong; in 2006 it also includes 10 births to Hawaiians.

Figure 6. Percent of Births by Race/Ethnicity of Mother, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories. For detailed information on 2006 births by race/ethnicity of mother, see Tables 4-3 and 4-4, pages 94-97. Percents may not add to 100 due to rounding.

Marital Status of Mother

- In 2006, 34 percent of births were to unmarried women, compared with 28 percent in 1996 (Figure 8).
- In general, the percent of births to mothers who are unmarried decreases with age. Eighty-four percent of those aged 18-19 giving birth in 2006 were unmarried, compared with only 14 percent of those aged 30-34 (Figure 8).
- Between 1996 and 2006, the unmarried percentage increased in every maternal age group except mothers under 15 years old (Figure 8). The largest increase occurred among mothers aged 20-24 (from 47% to 59%—12 percentage points).

Figure 8. Percent of Births to Unmarried Mothers, by Age, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

- From 1996 to 2006, the percent of non-marital births increased among whites, American Indians, Hispanics/Latinos and Laotian/Hmong, and decreased slightly in the “other Asian” group. The percent of non-marital births among blacks/African Americans stayed the same over the decade (Figure 9).
- The Wisconsin percent of births to unmarried mothers in 2006 (34%) was lower than the national percent in 2004 (36%). However, the percent of births to unmarried mothers was higher in Wisconsin than nationally among whites (26% vs. 25%), blacks/African Americans (83% vs. 69%) and Hispanics/Latinos (51% vs. 46%).

Figure 9. Percent of Births to Unmarried Mothers, by Race/Ethnicity, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories.

Education of Mother

- In 2006, 15 percent of women who gave birth had not finished high school, compared to 16 percent in 1996 (Figure 10). By age, the percentages with less than a high school education in 2006 were:

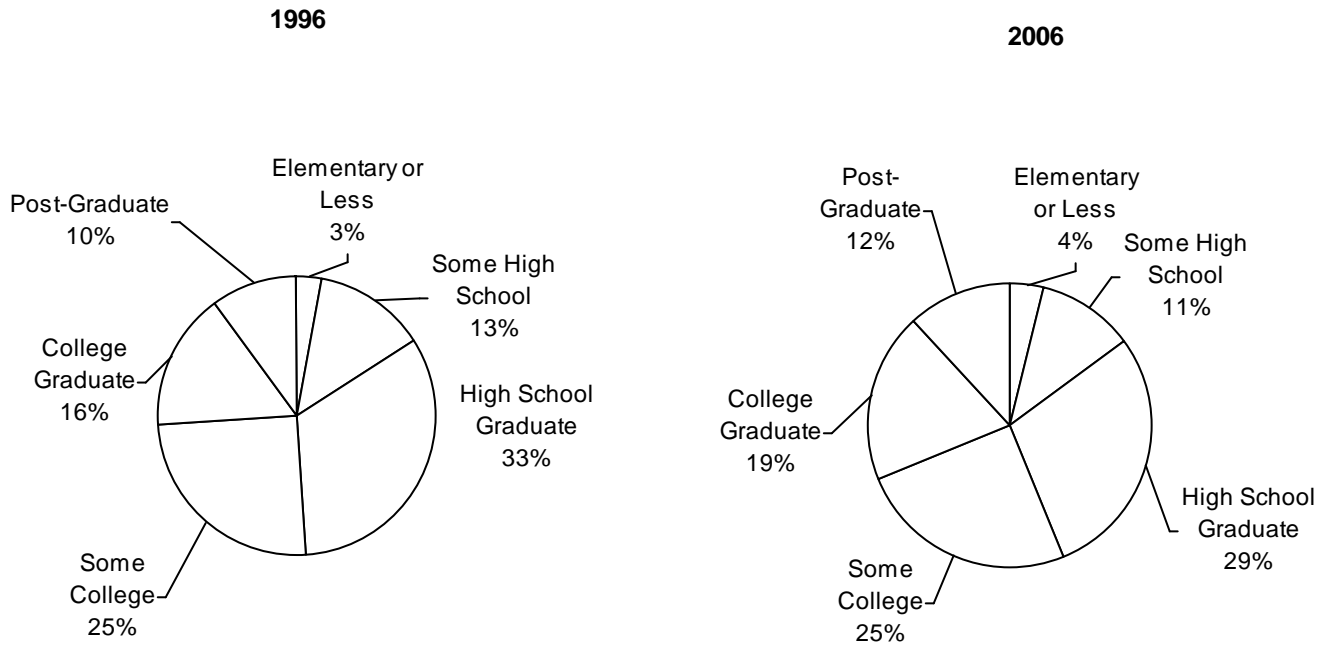

- 91% among mothers less than 18
- 35% among mothers 18-19
- 21% among mothers 20-24
- 10% among mothers 25-29
- 7% among mothers 30-34
- 7% among mothers 35-39
- 11% among mothers 40 or older

- On average, mothers in minority race/ethnicity groups were less likely to have completed high school. In 2006, the proportions of births to women with less than a high school education were:

- 8% among whites
- 33% among blacks/African Americans
- 28% among American Indians
- 50% among Hispanics/Latinos
- 32% among Laotian/Hmong
- 8% among other Asian groups

- Fifty-six percent of women who gave birth in 2006 had attended college for one year or more (Figure 10). The comparable percentage in 1996 was 51 percent.

Figure 10. Percent of Births by Education of Mother, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: “Some High School” or “Some College” means the mother completed at least one year of schooling at that level. For detailed information on 2006 births by education of mother, see Tables 4-1 through 4-5, pages 92-99. Percents may not add to 100 due to rounding.

Characteristics of the Pregnancy and Delivery

Prenatal Care

- The overall proportion of women who received first-trimester prenatal care was 84 percent in 2006, the same as in 1996 (Figure 11).
- In 2,219 births in 2006, the mother either did not begin prenatal care until the third trimester of pregnancy (1,631 births) or received no care at all (588 births) (Table 2-22). These births with “late or no prenatal care” constituted 3.1 percent of all births (down from 3.3 percent in 1996).
- Patterns of prenatal care initiation by age were similar in 1996 and 2006 (Figure 11).
- The percent of Wisconsin women who received first-trimester prenatal care in 2006 (84%) was the same as the 2004 national figure (84%).

Figure 11. Percent of Births to Mothers Who Received First-Trimester Prenatal Care, by Age, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

- From 1996 to 2006, the proportion of women receiving first-trimester care increased within each race/ethnicity group except whites. The increase was especially striking among African American and Laotian/Hmong women (Figure 12).

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories.

Cigarette Smoking

- Smoking during pregnancy poses risks for fetal development and infant health. Maternal smoking is associated with low birthweight in two ways: it slows fetal growth during gestation and increases the risk of a premature birth.
- The proportion of women who reported they smoked during pregnancy decreased from 18 percent of births in 1996 to 15 percent of births in 2006 (Figure 13).
- From 1996 to 2006, smoking during pregnancy declined in each maternal age group (Figure 13).

Figure 13. Percent of Births to Mothers Who Reported Smoking Cigarettes During Pregnancy, by Age, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: For detailed information on 2006 births by smoking behavior during pregnancy, see Tables 4-1 through 4-5, pages 92-99.

- From 1996 to 2006, the percentage of mothers who reported smoking during pregnancy declined in most race/ethnicity groups (Figure 14). The only exception was found among Laotian/Hmong women.
- No data are presented on mother’s self-reported use of alcohol during pregnancy because this item appears to be under-reported on the birth reporting form. This conclusion is based on the inconsistency between birth certificate data (1.0% of new mothers reported drinking during pregnancy in 2006) and the 2006 Behavioral Risk Factor Survey (66% of Wisconsin women aged 18-44 reported drinking within the past month).

Figure 14. Percent of Births to Mothers Who Reported Smoking Cigarettes During Pregnancy, by Race/Ethnicity, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories. For detailed information on 2006 births by smoking behavior during pregnancy, see Tables 4-1 through 4-5, pages 92-99.

Medical Risk Factors

The most frequently reported maternal medical risk factors reported for 2006 births were sexually transmitted diseases (reported in 6.3 percent of births), hypertension (6.0 percent), lung disease (4.8 percent), diabetes (4.6 percent), a previous preterm or small-for-gestational age infant (3.7 percent), and anemia (3.1 percent) (Table 1-6).

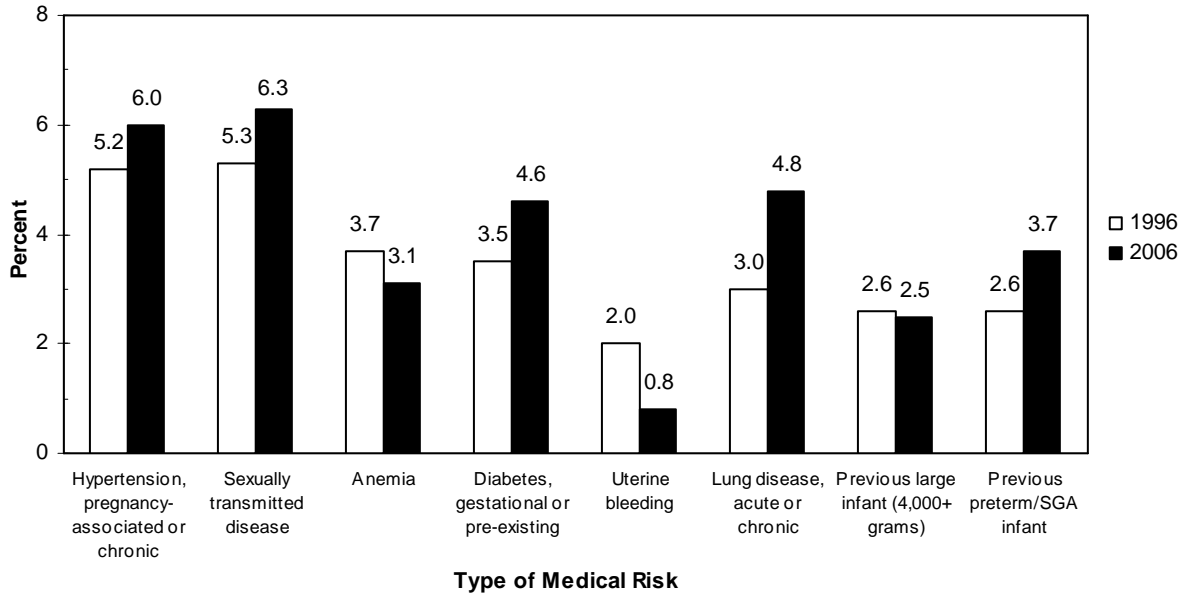

Table 1-6. Births with Reported Medical Risk Factors, Wisconsin, 2006

	Number	Percent
Sexually Transmitted Diseases	4,582	6.3%
Hypertension	4,364	6.0
Pregnancy-Associated	3,527	4.9
Chronic	837	1.2
Diabetes	3,297	4.6
Gestational	2,783	3.8
Pre-Existing	514	0.7
Anemia	2,221	3.1
Lung Disease, Acute or Chronic	3,462	4.8
Previous Preterm/Small for Gestational Age Infant	2,668	3.7
Previous Large Infant (4,000+ grams)	1,772	2.5
Uterine Bleeding	598	0.8
Cardiac Disease	574	0.8
Hydramnios/Oligohydramnios	787	1.1
Renal Disease	478	0.7
Rh Sensitization	568	0.8
Eclampsia	180	0.2
Incompetent Cervix	266	0.4
Hemoglobinopathy	226	0.3
Any Reported	33,865	46.8

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 109) for definitions of maternal medical risk factors. Since more than one medical risk factor may be indicated for each birth, and since conditions in the “other” checkbox are not reported in this table, columns will not sum to the “any reported” line.

Figure 15. Percent of Births with Selected Maternal Medical Risk Factors, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Methods of Delivery

In 2006, the following methods of delivery were reported:

Vaginal (no previous C-section)	52,713	72.9%
Primary C-Section	10,342	14.3
Repeat C-Section	7,418	10.3
Vaginal After Previous C-Section (VBAC)	1,017	1.4
Forceps	812	1.1
Other	0	0.0
Total Births	72,302	100.0%

- The overall percent of cesarean sections increased from 17.6 percent of births in 1990 to 24.6 percent in 2006. The cesarean section percentage was at its lowest point in 1995 (14.8%) and has increased every year since then.
- Primary cesarean sections increased from 10.2 percent of births in 1990 to 14.3 percent in 2006.
- Repeat cesarean sections increased from 7.3 percent of births in 1990 to 10.3 percent in 2006.

Figure 16. Cesarean Sections as a Percent of All Births, 1990-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

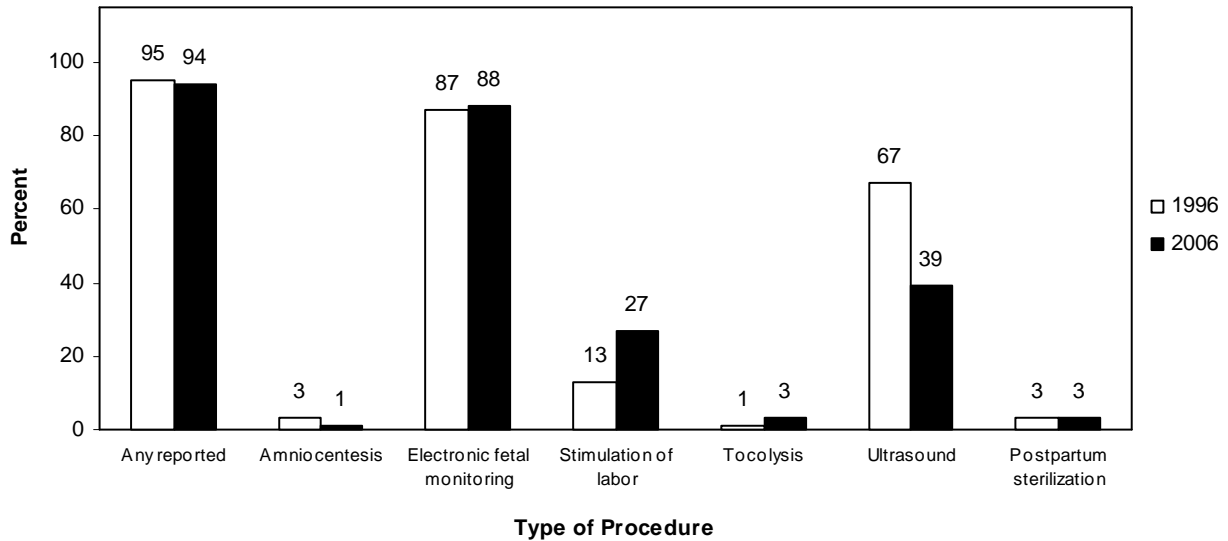

Obstetric Procedures

In 2006, births with reported obstetric procedures included:

Electronic fetal monitoring	63,717	88.1%
Ultrasound	28,123	38.9
Induction of labor	17,819	24.6
Stimulation of labor	19,717	27.3
Amniocentesis	649	0.9
Postpartum sterilization	2,279	3.2
Tocolysis	1,953	2.7
Other procedures	13	0.0
Births With Reported Procedure(s)	68,314	94.5

Notes: See Technical Notes (page 110) for definitions of obstetric procedures. Each birth could have more than one type of procedure reported.

Figure 17. Percent of Births with Obstetric Procedures Reported, Wisconsin, 1996 and 2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Characteristics of the Newborn

Low Birthweight

- In 2006, 4,994 Wisconsin infants were low birthweight; that is, they weighed less than 2,500 grams (about 5.5 pounds) at birth (Table 2-26). This total represented 6.9 percent of all births (compared to 7.0 percent in 2005). In comparison, 8.1 percent of all infants born in the United States in 2004 weighed less than 2,500 grams.
- Among these low birthweight infants, 914 were born at *very* low birthweight (less than 1,500 grams or about 3.3 pounds) and were thus at the highest risk for health problems (Table 2-26). The very low birthweight percentage was 1.3 percent among all births, and 1.0 percent of births to whites, 1.3 percent of births to Hispanics/Latinos, 3.0 percent of births to blacks/African Americans, 1.7 percent of births to American Indians, and 1.1 percent of births to Laotian/Hmong (Table 4-5).
- Compared with the overall incidence of low birthweight in 2006 (6.9 percent), higher percentages of low-birthweight infants were born to (Table 4-5):
 - Mothers who received no prenatal care (21.3 percent),
 - Mothers less than 15 years old (7.6 percent),
 - Non-Hispanic black/African American women (13.5 percent),
 - Women who smoked during pregnancy (10.8 percent),
 - Women who were unmarried (9.2 percent),
 - Women with less than a high school education (8.8 percent).
- From 1996 to 2006, the low birthweight percentage among infants born to mothers less than 18 years of age fluctuated from a low of 9.0 percent in 1996 to a high of 11.7 percent in 1998. In 2006, this percentage was 11.0 (compared with 6.8 percent among mothers age 18 and older).
- Forty-two percent of premature infants were of low birthweight (Table 4-5).
- Twins or other multiple births made up 24.8 percent of all low-birthweight births in 2006.

Figure 18. Percent of Births at Low Birthweight (< 2,500 grams), Wisconsin, 1996-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

- Three-year rolling average low birthweight percentages provide stable points of comparison to examine the low birthweight disparity in African American births over time. In the three-year period 2004-2006, 11.4 percent of black/African American infants and 5.6 percent of white infants weighed less than 2,500 grams or about 5.5 pounds at birth. The disparity ratio was 2.0, meaning that African American infants were born at low birthweight twice as frequently as white infants during the 2004-2006 period.
- The disparity between African American and white low birthweight rates has lessened since 1990-1992 (from 2.6 to 2.0), not because the African American low birthweight rate has improved but because the white low birthweight rate has increased.
- The disparity between African American and white infants is even greater for very low birthweight (less than 1,500 grams or about 3.3 pounds at birth). Infants born at these weights are at the highest risk of dying or experiencing other poor health outcomes. In 2004-2006, African American infants were more than three times as likely to be born at very low birthweight as were white infants. The magnitude of disparity in very low birthweight has changed little since 1990-1992.

Table 1-7. Percent of Births at Low Birthweight and Very Low Birthweight and Black/White Disparity Ratios, Three-Year Rolling Averages, Wisconsin 1990-2006

Years	Percent Low Birthweight			Percent Very Low Birthweight		
	Black/African American	White	Disparity Ratio	Black/African American	White	Disparity Ratio
1990-1992	10.9%	4.2%	2.6	3.1%	0.9%	3.4
1991-1993	10.9	4.2	2.6	3.0	0.9	3.3
1992-1994	11.0	4.3	2.6	2.9	0.9	3.2
1993-1995	11.1	4.3	2.6	3.0	0.9	3.3
1994-1996	10.7	4.4	2.4	3.0	1.0	3.0
1995-1997	10.2	4.4	2.3	3.1	1.0	3.1
1996-1998	10.3	4.6	2.2	3.0	1.0	3.0
1997-1999	10.6	4.7	2.3	2.9	1.0	2.9

1999-2001	10.1	4.8	2.1	3.2	1.1	2.9
2000-2002	10.0	4.8	2.1	3.4	1.0	3.4
2001-2003	10.0	4.9	2.0	3.4	1.0	3.4
2002-2004	10.3	5.0	2.1	3.3	1.0	3.3
2003-2005	10.3	5.2	2.0	3.4	1.0	3.4
2004-2006	11.4%	5.6%	2.0	3.3%	1.0%	3.3

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Percent low birthweight is the percent of births to mothers in each race/ethnicity group that were low birthweight (less than 2,500 grams).

Percent very low birthweight is the percent of births to mothers in each race/ethnicity group that were very low birthweight (less than 1,500 grams).

The disparity ratio is the percentage of low birthweight (or very low birthweight) among black/African American infants divided by the corresponding percentage among white infants.

Prematurity

- In 2006, 8,104 Wisconsin infants were born prematurely (with a gestation of less than 37 weeks) (Table 4-1). This total represented 11.2 percent of all births (a decrease from 11.3% in 2005). (See Technical Notes, page 108, for full definition of prematurity.)
- Compared with the overall proportion of premature infants in 2006 (11.2 percent), higher percentages of premature infants were born to:
 - Non-Hispanic black/African American women (17.8 percent),
 - Teenagers less than 18 years old (15.3 percent),
 - Women who were unmarried (13.6 percent),
 - Women who smoked during pregnancy (13.0 percent),
 - Women with less than a high school education (13.5 percent),
- Sixty-eight percent of low birthweight infants (birthweight under 2,500 grams) were premature.
- Twins or other multiple births made up 15.8 percent of all premature births in 2006. From 1996 to 2006, multiple births increased from 2.8 percent to 3.1 percent of all births.
- Prematurity increased from 9.9 percent of all births in 1996 to 11.2 percent of all births in 2006 (Figure 19).
- Prematurity among infants born to mothers less than 18 years of age was 15.3 percent in 2006, higher than the 1996 percent (14.6) (Figure 19). The prematurity rate among infants born to mothers 18 and older was 11.1 percent in 2006.

Figure 19. Percent of Premature Births, Wisconsin, 1996-2006

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: 'Premature' means less than 37 weeks of gestation. Since 1980, gestational age has been calculated as the difference between the date of last normal menses and the date of delivery. Since 1993, clinical estimate of gestation has been substituted where date of last normal menses is unknown. Since 2004, if the date of last normal menses was unknown or invalid or the computed estimate of gestational age was less than 16 weeks or greater than 45 weeks, then the clinical estimate of gestation was used.

Congenital Anomalies

Figure 20. Number of Reported Congenital Anomalies, Wisconsin 2006

Source: Wisconsin resident birth certificates, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Table 1-8. Reported Congenital Anomalies, Wisconsin 2006

Other Central Nervous System	18	Club Foot	56
Heart, Circulatory, Respiratory	196	Diaphragmatic Hernia	9
Heart Malformations	124	Other Musculoskeletal/ Integumental	132
Other Circulatory/Respiratory	78	Malformation Syndromes	107
Gastro-Intestinal	94	Down Syndrome	72
Rectal Atresia, Stenosis	14	Other Chromosomal	38
Tracheo-Esophageal Fistula	15	All Other	129
Omphalocele, Gastroschisis	34		
Other Gastrointestinal	33		

Source: Wisconsin resident birth certificates, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: These numbers reflect only those congenital anomalies that can be discerned at birth and are reported on the birth certificate. Many are not detected before the newborn is discharged from the hospital. Since more than one anomaly may be reported for each infant, the columns do not add to total. This table is not comparable with congenital anomalies data published prior to 1989; see Technical Notes for explanation.

Mortality

- In Wisconsin, 462 infants under the age of one year died in 2006 (Table 2-28). The 2006 infant mortality rate was 6.4 infant deaths per 1,000 live births, compared to 6.6 in 2005 and 7.3 in 1996 (Figure 21). The 2004 U.S. infant mortality rate (the latest available data) was 6.8 infant deaths per 1,000 live births.
- There were 311 neonatal deaths (deaths of infants less than 28 days of age) in 2006, accounting for 67 percent of total infant deaths that year. The neonatal mortality rate in 2006 was 4.3 neonatal deaths per 1,000 live births, compared with 4.5 in 2005 and 4.7 in 1996 (Figure 21). In the U.S. in 2004 (the latest available data), the neonatal mortality rate was 4.5 per 1,000 live births.
- The fetal death rate (fetal deaths per 1,000 live births and fetal deaths) was 5.3 in 2006 (Figure 21). In comparison, the fetal death rate for 1996 was 6.2 per 1,000. (For the definition of “fetal death,” see Technical Notes, page 108.)
- Infants born to teenagers are at a higher risk of death than infants born to older mothers. In 2006, the infant mortality rate was 8.7 per 1,000 births among infants born to mothers aged less than 20, compared with 6.2 per 1,000 among infants born to women aged 20 and older.
- There were 15 maternal deaths in 2006; these are deaths attributed to pregnancy-related health conditions or events of delivery.

Figure 21. Infant, Neonatal, and Fetal Mortality Rates, 1970-2006

Source: Resident birth certificates, matched birth-death file, and fetal death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: An infant death is one that occurs before one year of age. The infant death rate is the number of resident infant deaths divided by total resident live births times 1,000. For detailed information on 2006 infant, neonatal and fetal deaths, see Table 4-8, pages 102-103.

- The black/African American infant mortality rate for 2006 was 17.2 deaths per 1,000 births to black mothers, compared to 15.0 in 2005 and 18.3 in 1996. The 2006 white infant mortality rate was 4.9 deaths per 1,000 births to white women, compared to 5.6 in 2005 and 5.9 in 1996. The Hispanic/Latino infant mortality rate for 2006 was 6.3 deaths per 1,000 births to Hispanic/Latino women, compared to 6.7 in 2005 and 10.2 in 1996. The number of American Indian infant deaths in any single year was too small to present a rate.
- Based on three-year rolling average infant mortality rates (Figure 22), American Indian infant mortality has dropped markedly since 1984. The rate was 19.6 per 1,000 live births in 1984-1986 and 8.1 per 1,000 in 2004-2006.
- The African American infant mortality rate has remained much higher than the rate for other populations in Wisconsin for two decades. The three-year average rate was 18.4 per 1,000 live births in 1984-1986, declined to a low of 14.3 per 1,000 live births in 1991-1993, but increased again to 17.2 in 2004-2006.
- The Hispanic/Latino infant mortality rate fluctuated but remained essentially unchanged; it was 6.4 per 1,000 live births in 1984-1986 and 6.0 per 1,000 in 2004-2006.
- Total infant mortality and white infant mortality declined gradually over the 1984-2006 period, to 6.3 and 5.0, respectively.

Figure 22. Infant Mortality Rates by Race/Ethnicity, Three-Year Rolling Averages, 1984-2006

Source: Resident birth certificates, matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: An infant death is one that occurs before one year of age. The infant death rate is the number of resident infant deaths divided by total resident live births times 1,000. For detailed information on 2006 infant, neonatal and fetal deaths, see Table 4-8, pages 102-103. Total includes all infant deaths, including Asian and "Other," too small to be shown separately.

- From 1990-1992 to 2004-2006, the non-Hispanic white infant mortality rate for mothers less than 20 years old dropped from 12.4 to 8.5 deaths per 1,000 live births. The black/African American infant mortality rate for mothers less than 20 reached a low in 1991-1993 at 14.4 and a high in 2001-2003 at 21.4. In 2004-2006, the rate was 17.8. The Hispanic/Latino infant mortality rate for mothers less than 20 dropped from 14.4 deaths per 1,000 live births in 1992-1994 to 7.3 in 2004-2006.
- In 1990-1992, the non-Hispanic white infant mortality rate for mothers aged 20 or older was 6.6. This rate dropped to 4.8 in 2004-2006. The Hispanic/Latino infant mortality rate for mothers aged 20 or older was 6.7 in 1990-1992 and 5.8 in 2004-2006. The non-Hispanic black/African American infant mortality rate for mothers aged 20 or older was the only rate to increase since 1990-1992. In 1990-1992, the rate was 15.5 compared to 16.9 in 2004-2006.

Table 1-9. Infant Mortality Rates by Race/Ethnicity and Mother's Age, Three-Year Rolling Averages, Wisconsin 1990-2006

Years	Non-Hispanic White		Non-Hispanic Black/African American		Hispanic/Latino	
	<20	20+	<20	20+	<20	20+
1990-1992	12.4	6.6	16.5	15.5	-	6.7
1991-1993	11.3	6.7	14.4	14.3	-	7.2
1992-1994	10.5	6.3	15.3	16.0	14.4	6.9
1993-1995	10.5	6.3	16.4	17.4	-	8.3
1994-1996	10.6	5.8	17.0	18.8	-	9.3
1995-1997	10.3	5.5	16.5	16.6	-	10.2
1996-1998	10.0	5.3	17.5	16.2	14.7	9.4
1997-1999	9.9	5.3	17.9	14.4	17.3	7.7
1998-2000	9.9	5.3	17.9	16.0	14.8	5.8
1999-2001	9.4	5.4	18.1	16.3	10.2	5.6
2000-2002	9.3	5.3	19.4	17.4	-	6.1
2001-2003	8.4	5.3	21.4	16.1	8.4	6.5
2002-2004	8.7	4.8	21.0	16.5	8.4	5.7
2003-2005	9.0	4.9	20.1	15.4	8.9	5.7
2004-2006	8.5	4.8	17.8	16.9	7.3	5.8

Source: Resident birth certificates, matched birth-death file, and fetal death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: A '-' indicates that there were not enough infant deaths to present a rate. An infant death is one that occurs before one year of age. The infant death rate is the number of resident infant deaths divided by total resident live births times 1,000. For detailed information on 2006 infant, neonatal and fetal deaths, see Table 4-8, pages 102-103.

- The disparity ratio between the black/African American infant mortality rate and the white infant mortality rate increased dramatically from the 1990-1992 period (2.2) to the 2004-2006 period (3.4) (Figure 23). The disparity ratio is the black/African American rate divided by the white rate, and is one measure of the difference in magnitude between the two rates.
- In contrast, the disparity ratio between the black/African American low birthweight rate and the white low birthweight rate gradually decreased over the 15-year period (Figure 23 and Table 1-7). It was 2.0 in 2004-2006.
- The disparity ratio between the black/African American very low birthweight rate and the white very low birthweight rate decreased during the 1990's, but increased again thereafter. It was 3.3 in 2004-2006.

Figure 23. Black/White Disparity Ratio for Infant Mortality, Low Birthweight and Very Low Birthweight, Three-Year Rolling Averages, 1990-2006

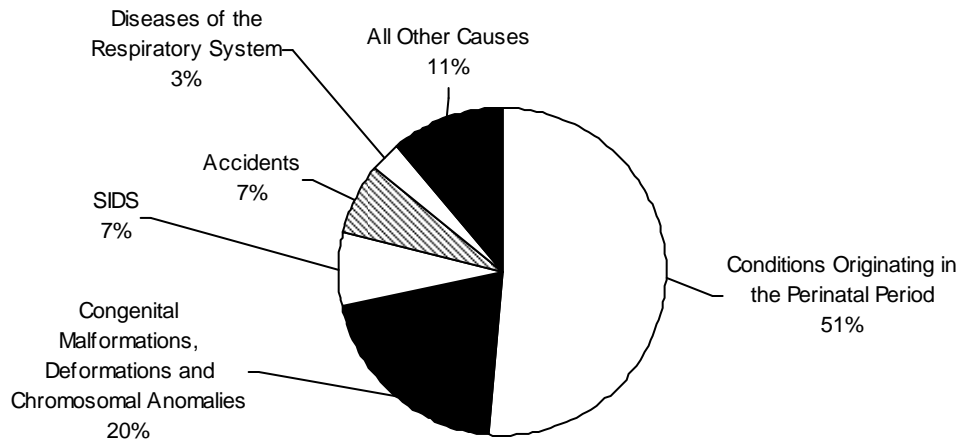

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The disparity ratio is the black/African American rate divided by the white rate.

Causes of Infant Death

- “Conditions originating in the perinatal period” accounted for 51 percent of infant deaths in 2006 (Figure 24). This category includes a variety of conditions that occur just before, during and after birth, such as pregnancy complications; complications of the placenta, cord and membranes; and unspecified prematurity and low birthweight (Figure 25).
- Congenital malformations, deformations and chromosomal anomalies accounted for 20 percent of infant deaths in 2006.
- Seven percent of infant deaths in 2006 were attributed to Sudden Infant Death Syndrome (SIDS); another 7 percent of infant deaths were the result of accidents.

Figure 24. Leading Causes of Infant Death, 2006

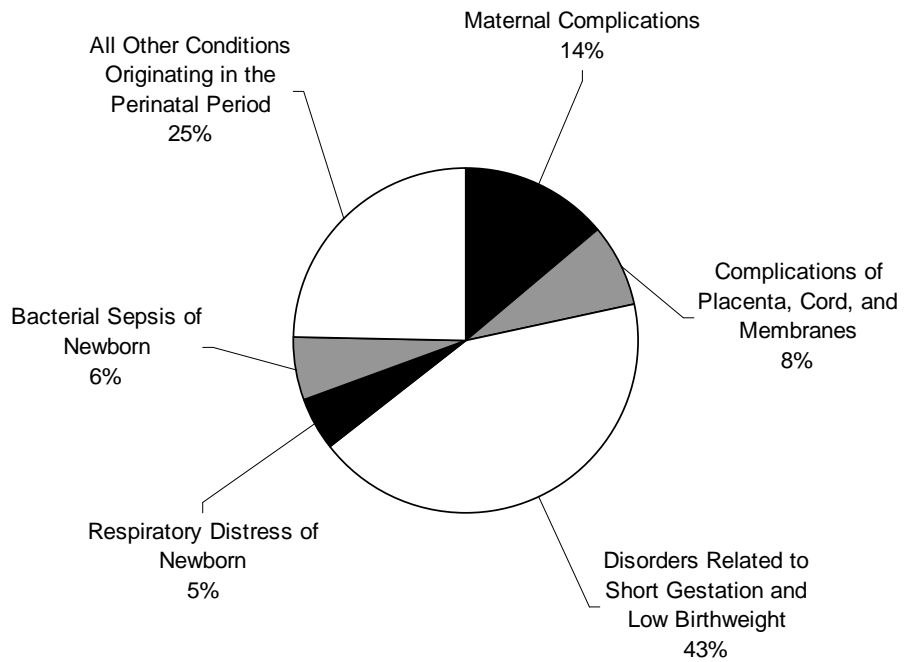

Source: Matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Beginning with 1999 data, causes of death have been coded using the International Classification of Diseases, Tenth Revision (ICD 10). This may affect comparability with previous years for some categories of death. See Technical Notes, page 108.

Percents in this figure are based on all infant deaths.

Figure 25. Causes of Infant Death: Conditions Originating in the Perinatal Period, 2006

Source: Matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Beginning with 1999 data, causes of death have been coded using the International Classification of Diseases, Tenth Revision (ICD 10). This may affect comparability with previous years for some categories of death. See Technical Notes, page 108.

Percents in this figures are based on those infant deaths categorized as “conditions originating in the perinatal period.”

Notes: The crude birth rate is the number of resident live births divided by the resident population times 1,000. The general fertility rate is the number of resident live births divided by the number of females ages 15-44 times 1,000. Population estimates are from the United States Census Bureau and the Wisconsin Department of Administration, Demographic Services Center. These estimates are provisional and subject to revision.

		Total	1,054

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: This table shows the number of Wisconsin resident births in 2006 that occurred at home by the county in which the birth occurred. In 2006, there was one birth in which the county of birth was unknown. Almost all births (71,087 or 98 percent) occurred in hospitals. A dash (-) indicates there were no home births in that county.

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: "Some High School" or "Some College" means the mother completed at least one year of schooling at that level. Included in the totals are 468 births for which education of mother was not reported. For maps of the Department of Health and Family Services (DHFS) and Perinatal Regions, see Technical Notes (pages 105 and 106).

Notes: Included in the totals are 14 births for which birthweight was not reported. Infants weighing less than 2,500 grams (5.5 pounds) at birth are considered low birthweight. Infants weighing less than 1,500 grams (3.3 pounds) at birth are considered very low birthweight. A dash (-) indicates that there were no births in that category.

Source: Fetal death and matched birth-death files, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The fetal death rate is based on the number of fetal deaths per 1,000 live births and reported fetal deaths. The neonatal death rate is based on the number of neonatal deaths per 1,000 live births. The infant death rate is based on the number of infant deaths per 1,000 live births. Rates based on fewer than 20 deaths are omitted because they are subject to large random fluctuations.

Source: Fetal death and matched birth-death files, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: A dash (-) indicates that there were no events in that category. This table includes cities, townships (T) and villages (V) with a population of 20,000 or more according to population estimates from the United States Census Bureau and the Wisconsin Department of Administration, Demographic Services Center. These population estimates are provisional and subject to revision. Combined areas include: Mequon (C) with Thiensville (V); and Neenah (C) with Menasha (C).

Notes: In Wisconsin counties close to the Michigan border, births for 1990 are underreported to an unknown extent since Michigan did not report Wisconsin resident births for that year. In particular, all 1990 births among Florence County residents occurred in Michigan. Numbers of births for 1996 reported here are slightly different from those published in the 1996 report because other states filed 74 duplicate records for Wisconsin residents. The 2004 births total initially reported has been corrected. A dash (-) indicates there were no births in that category.

Notes: Rates shown for ages <18 and <20 include births to mothers less than 15 years old, with population ages 15-17 and 15-19, respectively. Rates shown for age 40+ include births to mothers ages 45 or older, with population ages 40-44. See Technical Notes (page 107) for an explanation of birth rate calculations.

* Percentages are based on total live births.

** Rates are per 1,000 live births.

Notes: "Premature" means less than 37 weeks of gestation. Since 1980, gestational age has been calculated as the difference between the date of last normal menses and the date of delivery. Since 1993, clinical estimate of gestation has been substituted when date of last normal menses is unknown. Beginning in 2004, if the date of last normal menses was unknown or invalid or the computed estimate of gestational age was less than 16 weeks or greater than 45 weeks, the clinical estimate of gestation was substituted. Data for 1989-2003 shown on this page were recalculated to make them comparable with data for subsequent years, and differ from previously published data. Caution is advised in making comparisons between data for 1989-2006 and data for the years before 1989.

See Technical Notes (page 107) regarding comparability of data on congenital anomalies since 1989.

* Rates are per 1,000 live births.

- Rates based on fewer than 20 deaths are omitted because they are subject to large random fluctuations.

n/a Not available

Notes: See Technical Notes (page 107) for definition of race/ethnicity categories. Total includes all infant deaths, regardless of race/ethnicity. U.S. rates used in this table were cited from Mathews TJ, MacDorman MF. Infant mortality statistics from the 2004 period linked birth/infant death data set. National Vital Statistics Reports; vol. 55, no. 14. Hyattsville, Maryland: National Center for Health Statistics. 2007.

Notes: Included in the totals are 27 births for which race/ethnicity of mother was not reported. A dash (-) indicates that there were no births in that category. "Premature" means less than 37 weeks of gestation. Gestational age is calculated as the difference between the date of last normal menses and the date of delivery. Where date of last normal menses was unknown or invalid, i.e., less than 16 weeks or greater than 45 weeks, clinical estimate of gestation was substituted.

Notes: Included in the totals are 27 births for which race/ethnicity of mother was not reported. A dash (-) indicates that there were no births in that category. "Premature" means less than 37 weeks of gestation. Gestational age is calculated as the difference between the date of last normal menses and the date of delivery. Where date of last normal menses is unknown or invalid, i.e., less than 16 weeks or greater than 45 weeks, clinical estimate of gestation was substituted.

Source: Fetal death and matched birth-death files, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: The fetal death rate is based on the number of fetal deaths per 1,000 live births and reported fetal deaths. The neonatal death rate is based on the number of neonatal deaths per 1,000 live births. The infant death rate is based on the number of infant deaths per 1,000 live births. Rates based on fewer than 20 deaths are omitted because they are subject to large random fluctuations.

Table 4-9. Selected Birth Rates, Mortality Rates, and Birth Characteristics, Wisconsin 2006 and United States, 2004

Birth Rates	Wisconsin		United States
	Rate		Rate
Crude Birth Rate (births per 1,000 total population)	12.9		14.0
General Fertility Rate (births per 1,000 females ages 15-44)	63.4		66.3
Teen Birth Rate (births per 1,000 females ages 15-19)	30.6	31.1*	41.1
Mortality Rates			
Infant Mortality Rate (infant deaths per 1,000 live births)	6.4		6.8
Infant Mortality Rate – Black Non-Hispanic	17.2		13.6
Infant Mortality Rate – White Non-Hispanic	4.9		5.7
Neonatal Mortality Rate (deaths <28 days of age per 1,000 live births)	4.3		4.5
Perinatal Mortality Rate (fetal deaths and deaths <28 days of age per 1,000 live births and fetal deaths)	11.6	6.5**	6.9***
Birth Characteristics			
	Percent		Percent
Mother Unmarried	34.3%		35.8%
First-Trimester Prenatal Care	83.8		83.9
Late or No Prenatal Care	3.1		3.6
Maternal Smoking	14.8		10.2
C-Section Delivery	24.6		29.1
Birth Order 4+	11.9		11.0
Low Birthweight	6.9		8.1
Low Birthweight – Black Non-Hispanic	13.5		13.7
Low Birthweight – White Non-Hispanic	6.2%		7.2%

* This Wisconsin rate is calculated to be comparable to previous Wisconsin publications, which included births to mothers younger than 15. See Technical Notes (page 107) for an explanation of birth rate calculations.

** This Wisconsin rate is calculated to be comparable to the U.S. rate, which includes the number of late fetal deaths (greater than or equal to 28 weeks of gestation) plus infant deaths within seven days of birth per 1,000 live births plus late fetal deaths.

*** Rate for 2002, the latest available data. The US perinatal mortality rate is cited from Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System: Hoyert DL, Heron M, Murphy SL, Kung HC. Health, United States, 2005 With Chartbook on Trends in the Health of Americans. Hyattsville, Maryland: 2006.

Note: See Technical Notes (page 107) for explanation of Perinatal Regions.

Sources, Definitions, and Explanations of Terms

National Data. Unless otherwise noted, national data used in this report were cited from Martin JA, Hamilton BE, Sutton PD, et al. Births: Final data for 2004. *National Vital Statistics Reports*, Vol. 55, No. 1. Hyattsville, Maryland: National Center for Health Statistics, 2006. National infant mortality data are drawn from Mathews TJ, MacDorman MF. Infant mortality statistics from the 2004 period linked birth/infant death data set. *National Vital Statistics Reports*, Vol. 55, No. 15. Hyattsville, Maryland: National Center for Health Statistics, 2007.

Birth Rate Calculations. Beginning with this publication of 2006 Wisconsin birth data, a change was made in the way birth rates at the youngest and oldest maternal ages are calculated. This change was made to make the rates comparable to national statistics.

In previous years, Wisconsin teen birth rates (the rate of births to mothers aged 15-19, and the rate of births to mothers aged 15-17) included births to mothers under age 15 in the numerator. The rate was calculated as the number of births to mothers less than 20 (or less than 18) divided by the number of females aged 15-19 (or 15-17), multiplied by 1,000. In this report, births to mothers aged 10-14 were placed in a separate category whenever birth rates were shown.

Similarly, births to mothers aged 45 and older were previously included in birth rates for women aged 40-44; the result was then divided by the number of females aged 40-44 and multiplied by 1,000. In this report, births to women 45 years of age and older were removed from the 40-44 birth rate calculations.

Table 1-1, Figure 2, Figure 4, and Table 3-2 have been affected by these changes.

Race/Ethnicity Classifications. All live births, fetal deaths and infant deaths were classified by race/ethnicity and Hispanic/Latino origin of mother into one of six categories: non-Hispanic white, non-Hispanic black or African American, non-Hispanic American Indian, Hispanic or Latino, non-Hispanic Laotian or Hmong, and non-Hispanic "other Asian," which includes Asian groups other than Laotian/Hmong, as well as Pacific Islanders such as Hawaiians. Hispanics/Latinos may be of any race.

Prior to 1994, Wisconsin birth reports included a Race/Ethnicity category labeled "Indochinese." Beginning in 1994, this category was redefined as "Laotian/Hmong" (constituting approximately 95 percent of the Indochinese category). The remaining 5 percent of births in the Indochinese category were reallocated to the "Other" grouping; this includes Vietnamese, Cambodian, Thai, Chinese, Japanese, and East Indian.

The Asian category used in birth rates by race/ethnicity calculations is made up of Chinese, Japanese, Filipino, Other Asian/Pacific Islander, Laotian, Vietnamese, Korean, Cambodian, and Hmong.

Birth Certificate Checklists. Since 1989, data on maternal health, pregnancy, delivery, and some dimensions of birth outcomes are collected in the following birth certificate checklists: "Medical history for this pregnancy," "Obstetric procedures," "Events of labor and/or delivery," "Method of delivery," "Abnormal conditions of the newborn," and "Congenital anomalies of child." These data were previously collected in a fill-in-the-blank format. Thus, data presented in annual reports for 1982-1988 on risk and treatment ("Type of delivery," "Concurrent conditions of pregnancy," "Complications of pregnancy," "Complications of delivery," and "Congenital anomalies") are not comparable to the data presented in annual reports since 1989 (*Maternal and Child Health Statistics* and *Wisconsin Births and Infant Deaths*).

Also to be noted are the limitations on comparability that relate to changes in the editing of the medical

checklist items since 1989. Each checklist (with the exception of “Method of delivery”) has an “other-specify” checkbox. Conditions reported in the “other-specify” category have been edited to exclude invalid reports from the database, and to ensure that those conditions that belong elsewhere in a checklist are properly reported. The editing process has varied each year, which affects comparability. This most affects data on “Medical history for this pregnancy” and “Congenital anomalies of child;” it also affects comparability of “Events of labor and/or delivery” and “Abnormal conditions of the newborn.” In 1990, this editing was done only for the “Congenital anomalies” and “Abnormal conditions” checklists. Since 1990, edits have been expanded to include “Medical history for this pregnancy,” “Obstetric procedures,” and “Events of labor and/or delivery.”

Definitions of “Medical risk factors for this pregnancy,” “Obstetric procedures,” “Complications of labor and/or delivery,” “Abnormal conditions of the newborn” and “Congenital anomalies of child” were adapted from:

National Center for Health Statistics. Advance report of new data from the 1989 birth certificate. *Monthly Vital Statistics Report*; Vol. 40, No. 12, Supplement. Hyattsville, Maryland: Public Health Service, 1997.

Prematurity. Births were classified as premature (less than full term) if the gestational age was less than 37 weeks. To determine gestational age, a prematurity index is used; this is usually based on the computed estimate of gestational age, which is the difference between the date of last normal menses and the date of the infant’s birth. The clinical estimate of gestational age (reported by the physician directly on the birth certificate) is substituted when the date of last normal menses is unknown or invalid or the computed estimate of gestational age is less than 16 weeks or greater than 45 weeks. The use of this index decreases the number of records with unknown gestational age.

Mortality

Infant Deaths. The birth-death cohort is not completed until one full year after the end of the birth cohort calendar year. This publication reports mortality data on infants who died during 2006, rather than the mortality experience of the 2006 birth cohort, to allow more timely reporting on infant mortality.

Causes of Death. Causes of death in this report have been coded according to the International Classification of Diseases (ICD), Tenth Edition. Before the 1999 data year, causes of death were coded according to the ICD, Ninth Edition. This change does not affect comparability between years for four of the five leading causes of infant death shown in this report (Conditions Originating in the Perinatal Period; Congenital Malformations, Deformations and Chromosomal Anomalies; Sudden Infant Death Syndrome or SIDS; and Accidents – see Pages 34 and 35).

Fetal Deaths. A fetal death or stillbirth is “a fetus which, after complete expulsion or extraction from the woman, does not breathe or show other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles.” By Wisconsin statute, a stillbirth of at least 20 weeks’ gestation or 350 grams must be reported. (Note: A fetal death report is not used for induced terminations of pregnancy (induced abortions).) Some stillbirths (fetal deaths) to Wisconsin residents are not included in this publication because some were less than 20 weeks’ gestation, some occurred outside Wisconsin, and an unknown number that occurred within the state were not reported.

Perinatal Deaths. Includes all reported fetal deaths of 20 or more weeks of gestation and all neonatal deaths (deaths of liveborn infants occurring before 28 days of age).

Maternal Deaths. There were fifteen deaths in 2006 for which a maternal cause of death was reported on the death certificate. Before 1989, and beginning again in 1994, the Wisconsin Center for Health Statistics (now the Bureau of Health Information and Policy) followed up deaths of women of childbearing age with inquiries about pregnancy-related causes of death. Maternal deaths from 1989-1993 may be underreported because this special study was not conducted for those years. In 2003, an item was added to the Wisconsin death certificate that allows the medical certifier to specify the pregnancy status of the decedent. This should improve ascertainment of maternal deaths from death certificate records.

Perinatal Regions. These tables present birth information for each of the seven Perinatal Regions in Wisconsin (see Map 2, page 106). These regions were informally designated in the early 1970s by the Wisconsin Association for Perinatal Care, in cooperation with organizations representing public and private providers of perinatal services. Perinatal regions represent geographical boundaries within which arrangements exist among providers of perinatal services to facilitate optimal treatment for pregnant women and newborns. Within each region, selected hospitals with the capability to provide neonatal and maternal intensive care have been self-designated as perinatal centers. Women with high-risk pregnancies and deliveries are often referred to or transported to these perinatal centers, as are high-risk babies born outside perinatal centers. Health care providers within the regions also collaborate in other ways to address perinatal health care issues as they arise.

Limitations of the Data. Vital records information has some limitations related to completeness, accuracy, and timeliness of registration, quality control procedures and classification problems. The reporting of live births and infant deaths is considered to be essentially complete for births occurring in Wisconsin. A cooperative exchange program between all states has been in operation for several decades to allocate birth and death certificates to the state of residence. Although this exchange program is not totally complete, the incompleteness is not of sufficient magnitude to seriously affect statistics on natality and infant mortality.

Edit checks are incorporated in the software used for electronic transmission of birth certificate data, and the Vital Records Registration and Statistics Unit in the Bureau of Health Information and Policy reviews birth certificates and death certificates for logical inconsistencies. Some errors remain after this review, but they are thought to have little, if any, effect on statistical results.

There may be some underreporting of medical risk factors and types of obstetrical procedures performed. There may also be underreporting of congenital anomalies which are identifiable at birth; in addition, some congenital anomalies cannot be detected at the time the birth certificate is filed.

Medical Risk Factors for This Pregnancy: Definitions

<i>Anemia</i>	Maternal hemoglobin level of less than 10.0 g/dL during pregnancy, or a hematocrit of less than 30 percent during pregnancy.
<i>Cardiac Disease</i>	Disease of the heart.
<i>Acute or Chronic Lung Disease</i>	Disease of the lungs during pregnancy.

<i>Diabetes</i>	Metabolic disorder characterized by excessive discharge of urine and persistent thirst; includes juvenile onset, adult onset, and gestational diabetes during pregnancy.
<i>Genital Herpes</i>	Infection of the skin of the genital area by herpes simplex virus.
<i>Hydramnios/ Oligohydramnios</i>	Any noticeable excess (hydramnios) or lack (oligohydramnios) of amniotic fluid.
<i>Hypertension, Chronic Hypertension, Pregnancy- Associated</i>	Blood pressure persistently greater than 140/90, diagnosed prior to onset of pregnancy or before the 20 th week of gestation. An increase in blood pressure of at least 30 mm Hg systolic or 15 mm Hg diastolic on two measurements taken six hours apart after the 20th week of gestation.
<i>Eclampsia</i>	The occurrence of convulsions and/or coma unrelated to other cerebral conditions in women with signs and symptoms of preeclampsia.
<i>Incompetent Cervix</i>	A condition characterized by painless dilation of the cervix in the second trimester or early in the third trimester of pregnancy, with premature expulsion of membranes through the cervix and ballooning of the membranes into the vagina, followed by rupture of the membranes and subsequent expulsion of the fetus.
<i>Previous Infant 4,000+ Grams</i>	Previous birth of a live-born child with a birthweight of over 4,000 grams (8 lbs., 14 oz.).
<i>Previous Preterm or SGA Infant</i>	Previous birth of an infant prior to term (before 37 completed weeks of gestation), or of an infant weighing less than the 10th percentile for gestational age, using a standard weight-for-age chart. (SGA means “small for gestational age.”)
<i>Renal Disease</i>	Kidney disease.
<i>Rh Sensitization</i>	The process or state of becoming sensitized to the Rh blood factor, as when an Rh-negative woman is pregnant with an Rh-positive fetus.
<i>Uterine Bleeding</i>	Any clinically significant bleeding during the pregnancy, taking into consideration the stage of pregnancy; any second- or third-trimester bleeding of the uterus prior to the onset of labor.

Obstetric Procedures: Definitions

<i>Amniocentesis</i>	Surgical transabdominal perforation of the uterus to obtain amniotic fluid to be used in the detection of genetic disorders, fetal abnormalities, and fetal lung maturity.
<i>Electronic Fetal Monitoring</i>	Monitoring with external devices applied to the maternal abdomen or with internal devices with an electrode attached to the fetal scalp and a catheter through the cervix into the uterus, to detect and record fetal heart tones and uterine contractions.

<i>Induction of Labor</i>	The initiation of uterine contractions before the spontaneous onset of labor by medical and/or surgical means for the purpose of delivery.
<i>Stimulation of Labor</i>	Augmentation of previously established labor by use of oxytocin.
<i>Tocolysis</i>	Use of medications to inhibit preterm uterine contractions to extend the length of pregnancy and, therefore, avoid a preterm birth.
<i>Ultrasound</i>	Visualization of the fetus and the placenta by means of sound waves.

Congenital Anomalies: Definitions

<i>Anencephalus</i>	Absence of the cerebral hemispheres.
<i>Spina Bifida/ Meningocele</i>	Developmental anomaly characterized by defective closure of the bony encasement of the spinal cord, through which the cord and meninges may or may not protrude.
<i>Hydrocephalus</i>	Excessive accumulation of cerebrospinal fluid within the ventricles of the brain with consequent enlargement of the cranium.
<i>Microcephalus</i>	A significantly small head.
<i>Other Central Nervous System</i>	Other specified anomalies of the brain, spinal cord, and nervous system.
<i>Heart Malformations</i>	Congenital anomalies of the heart.
<i>Other Circulatory/ Respiratory</i>	Other specified anomalies of the circulatory and respiratory systems.
<i>Rectal Atresia/ Stenosis</i>	Congenital absence, closure, or narrowing of the rectum.
<i>Tracheo-Esophageal Fistula/Esophageal Atresia</i>	An abnormal passage between the trachea and the esophagus; esophageal atresia is the congenital absence or closure of the esophagus.
<i>Omphalocele/ Gastroschisis</i>	An omphalocele is a protrusion of variable amounts of abdominal viscera from a midline defect at the base of the umbilicus. In gastroschisis, the abdominal viscera protrude through an abdominal wall defect, usually on the right side of the umbilical cord insertion.
<i>Other Gastrointestinal</i>	Other specified congenital anomalies of the gastrointestinal system.
<i>Malformed Genitalia</i>	Congenital anomalies of the reproductive organs.
<i>Renal Agenesis</i>	One or both kidneys are completely absent.

<i>Other Urogenital</i>	Other specified congenital anomalies of the organs concerned in the production and excretion of urine, together with organs of reproduction.
<i>Cleft Lip/Palate</i>	Cleft lip is a fissure or elongated opening of the lip; cleft palate is a fissure in the roof of the mouth. These are failures of embryonic development.
<i>Polydactyly/Syndactyly, Adactyly</i>	Polydactyly is the presence of more than five digits on either hands and/or feet; syndactyly is having fused or webbed fingers and/or toes; adactyly is the absence of fingers and/or toes.
<i>Clubfoot</i>	Deformity of the foot, which is twisted out of shape or position.
<i>Diaphragmatic Hernia</i>	Herniation of the abdominal contents through the diaphragm into the thoracic cavity, usually resulting in respiratory distress.
<i>Other Musculo-Skeletal/Integumental</i>	Other specified congenital anomalies of the muscles, skeleton, or skin.
<i>Down Syndrome</i>	The most common chromosomal defect, with most cases resulting from an extra chromosome (trisomy 21).
<i>Other Chromosomal</i>	All other chromosomal aberrations.
