Release Notes 1.3.0.0

Transferred Screen Security Change

On May 4th 2010, the LTCare Data Warehouse team put in place a change that allows users of the functional screen data marts to see screens for additional individuals.

The original data warehouse security was designed to allow access to the screen data only for screens for which an agency had actually performed the eligibility calculation. In other words, you were only allowed to see screen data for individuals where your agency was the eligibility calculated agency. This caused problems for data warehouse users at the managed care organizations (MCO) because screens transferred to their MCO actually had eligibility calculated at the resource center. Those screens would not be available in the data warehouse to MCO users until someone at the MCO performed an eligibility calculation, which may not happen for up to a year.

Starting in release 1.3.0.0, functional screen data mart users will now see screen data for screens that meet one of the following conditions.

- The data warehouse user belongs to the agency that actually performed the eligibility calculation.
- The data warehouse user belongs to the agency that is the screening agency on the screen
- The data warehouse user belongs to an agency that is a super agency in a super/sub relationship.
- The data warehouse user belongs to an agency that is the "assigned to" agency in the transferred screen table (LTC_APPL_AGCY_ACS).
