Most Recent Screen Filters by Universal ID and by Master Client Index ID

During the use of the LTCare Data Warehouse functional screen data marts, a need was flushed out to develop two new filters in the functional screen data marts. The new filters allow the data analyst to filter for a person’s most recent functional screen by that person’s universal ID or their master client index ID. The LTCare functional screen data marts always had the ability to pull the most recent screen for each applicant screened by the functional screening tool, but the most recent screen was based on the screening tool’s unique applicant ID number. The problem is that the screening tool’s applicant ID number is not a shared number with any other system like the universal ID, and that is why the new filters are needed.

Two new filters have been added to each of the data marts. One filter will pull a person’s most recent screen based on the person’s universal ID along with the most recent eligibility calculation date, and the other filter will pull a person’s most recent screen based on the person’s master client index ID and the most recent eligibility calculation date.

The new filters are named as follows.

New Filter Name
Most Recent Adult Screens by MCI
Most Recent Adult Screens by Universal ID
Most Recent Child Screens by MCI
Most Recent Child Screens by Universal ID
Most Recent PCA Screens by MCI
Most Recent PCA Screens by Universal ID
