4. Possible side effects, warnings, and cautions associated with this medication are listed below. This is not an all-inclusive list but is representative of items of potential clinical significance to you. For more information on this medication, you may consult further with your physician or refer to a standard text, such as the PDR. As part of monitoring some of these potential side effects, your physician may order laboratory or other tests. The treatment team will closely monitor individuals who are unable to readily communicate side effects in order to enhance care and treatment.

Continued – Possible side effects, warnings, and cautions associated with this medication. **Most Common Side Effects** drowsiness, dizziness.

Less Common Side Effects gastrointestinal complaints, nervousness, blurred vision, dry mouth, headache, and mental confusion

#### **Rare Side Effects**

#### Caution

Precautions:

Access: FDA is advising that the opioid addiction medications buprenorphine or methadone should not be withheld from patients taking benzodiazepines or other drugs that depress the central nervous system (CNS). The combined use of these drugs increases the risk of serious side effects; however, the harm caused by untreated opioid addiction can outweigh these risks. Careful medication management by health care professionals can reduce these risks.

Concomitant use: Avoid use with other CNS depressants.

Hepatic: Use caution in patients with impaired hepatic function.

Neurologic: Interference with psychomotor performance may occur; use caution when engaging in hazardous occupations requiring mental alertness (eg, operating dangerous machinery including motor vehicles). Ataxia or excessive sedation may occur in elderly or debilitated patients; dosage adjustments and monitoring recommended.

Psychiatric: Use not recommended in depressive neuroses or psychotic reactions. Increased risk of suicidal thoughts or behavior has been reported; monitoring recommended. Use with caution for treatment of anxiety when there is any evidence of impending depression as suicidal tendencies may occur; protective measures may be necessary.

Renal: Use caution in patients with impaired renal function.

Reproductive: Use during the later stages of pregnancy can result in neonatal sedation (eg, respiratory depression, lethargy, hypotonia) and neonatal withdrawal syndrome (eg, hyperreflexia, irritability, restlessness, tremors, inconsolable crying, and feeding difficulties); monitoring required and medical management may be necessary.

Special populations (Beers Criteria): Avoid use in elderly due to greater benzodiazepine sensitivity, especially in patients with a history of falls or fractures (unless safer alternatives are not available), cognitive impairment or dementia, or with delirium or at high risk for delirium. May increase risk of syncope, falls fractures, ataxia, cognitive or psychomotor impairment, motor vehicle accidents, delirium, or other adverse CNS effects (may be appropriate for seizure disorders, rapid eye movement sleep disorders, benzodiazepine or ethanol withdrawal, severe generalized anxiety disorder, periprocedural anesthesia, and end-of-life care). Avoid concomitant use of 3 or more CNS-active agents in any combination due to increased risk of falls and fractures. Avoid concomitant use of any opioid due to increased risk of overdose.

Pediatrics: Use not recommended in pediatric patients younger than 9 years of age.

Withdrawal: A protracted withdrawal syndrome with symptoms lasting weeks to more than 12 months has been reported in patients taking benzodiazepines.

#### Warning

## Black Box Warning: Oral (Tablet)

Risks from Concomitant Use with Opioids; Abuse, Misuse, and Addiction; and Dependence and Withdrawal Reactions Concomitant use of benzodiazepines and opioids may result in profound sedation, respiratory depression, coma, and death. Reserve concomitant prescribing of these drugs in patients for whom alternative treatment options are inadequate. Limit dosages and durations to the minimum required. Follow patients for signs and symptoms of respiratory depression and sedation. The use of benzodiazepines, including clorazepate, exposes users to risks of abuse, misuse, and addiction, which can lead to overdose or death. Abuse and misuse of benzodiazepines commonly involve concomitant use of other medications, alcohol, and/or illicit substances, which is associated with an increased frequency of serious adverse outcomes. Before prescribing clorazepate and throughout treatment, assess each patient's risk for abuse, misuse, and addiction. The continued use of benzodiazepines, including clorazepate, may lead to clinically significant physical dependence. The risks of dependence and withdrawal increase with longer treatment duration and higher daily dose. Abrupt discontinuation or rapid dosage reduction of clorazepate after continued use may precipitate acute withdrawal reactions, which can be life-threatening. To reduce the risk of withdrawal reactions, use a gradual taper to discontinue clorazepate or reduce the dosage.

## See standard reference text for an all-inclusive list of side effects.

# By my signature below, I GIVE consent for the named medication on Page 1 and anticipated dosage range. My signature also indicates that I understand the following:

- I can refuse to give consent or can withdraw my consent at any time with written notification to the institution director or designee. This
  will not affect my right to change my decision at a later date. If I withdraw consent after a medication is started, I realize that the
  medication may not be discontinued immediately. Rather, it will be tapered as rapidly as medically safe and then discontinued so as to
  prevent an adverse medical consequence, such as seizures, due to rapid medication withdrawal.
- 2. Questions regarding this medication can be discussed with the Interdisciplinary Team, including the physician. The staff contact person can assist in making any necessary arrangements.
- 3. Questions regarding any behavior support plan or behavior intervention plan, which correspond with the use of the medication, can be directed to the client's social worker, case manager, or psychologist.
- 4. I have the right to request a review at any time of my record, pursuant to § 51.30(4)(d) or § 51.30(5)(b).
- 5. I have a legal right to file a complaint if I feel that client rights have been inappropriately restricted. The client's social worker, case manager, or agency/facility client rights specialist may be contacted for assistance.
- 6. My consent permits the dose to be changed within the **anticipated dosage range** without signing another consent.
- 7. I understand the reasons for the use of the medication, its potential risks and benefits, other alternative treatment(s), and the probable consequences that may occur if the proposed medication is not given. I have been given adequate time to study the information and find the information to be specific, accurate, and complete.
- 8. This medication consent is for a period effective immediately and not to exceed fifteen (15) months from the date of my signature. The need for and continued use of this medication will be reviewed at least quarterly by the Interdisciplinary Team. The goal, on behalf of the client, will be to arrive at and maintain the client at the minimum effective dose.
