

# HEPATITIS C IN WISCONSIN

## 2019 Summary Report

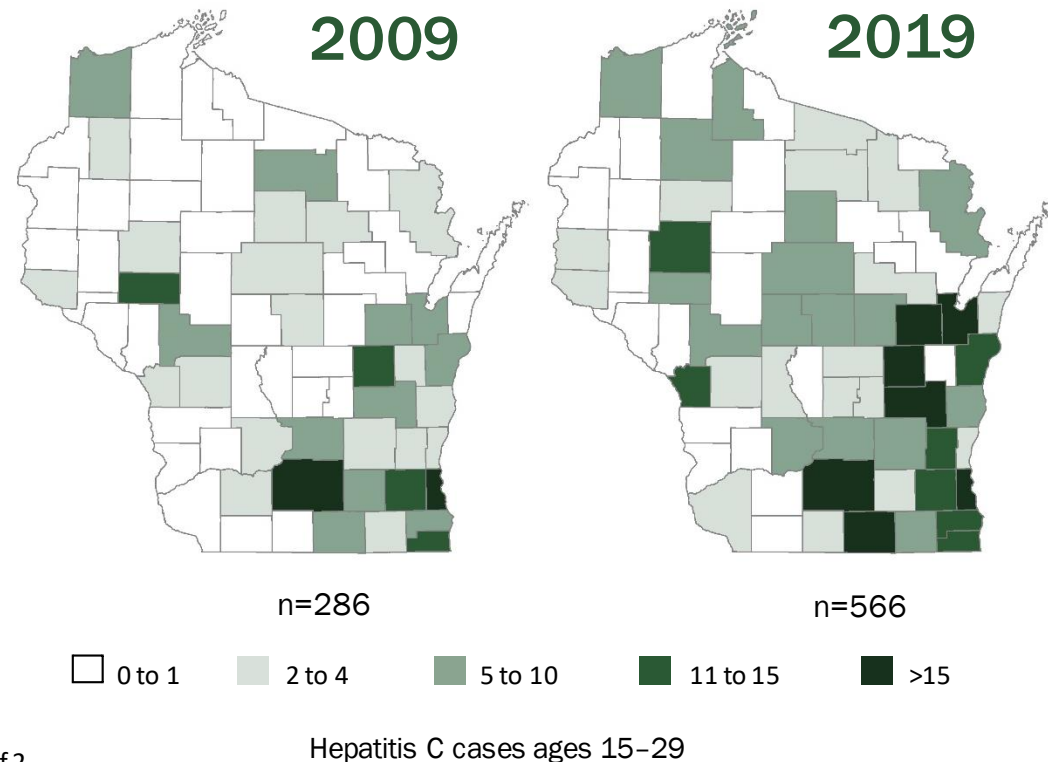

In 2019, the hepatitis C virus epidemic in Wisconsin continued, with 2,467 newly reported cases, including 119 acute and 2,348 chronic cases. **As many as 70,000 people are living with hepatitis C in Wisconsin, but only half (38,831) have been identified and reported.** For more information, visit the full [hepatitis C annual review for 2019](#).

### Hepatitis C Trends

The number of acute hepatitis C cases has increased over the past 10 years with 119 cases reported in 2019. **Most people with acute hepatitis C reported injecting drugs to get high.**

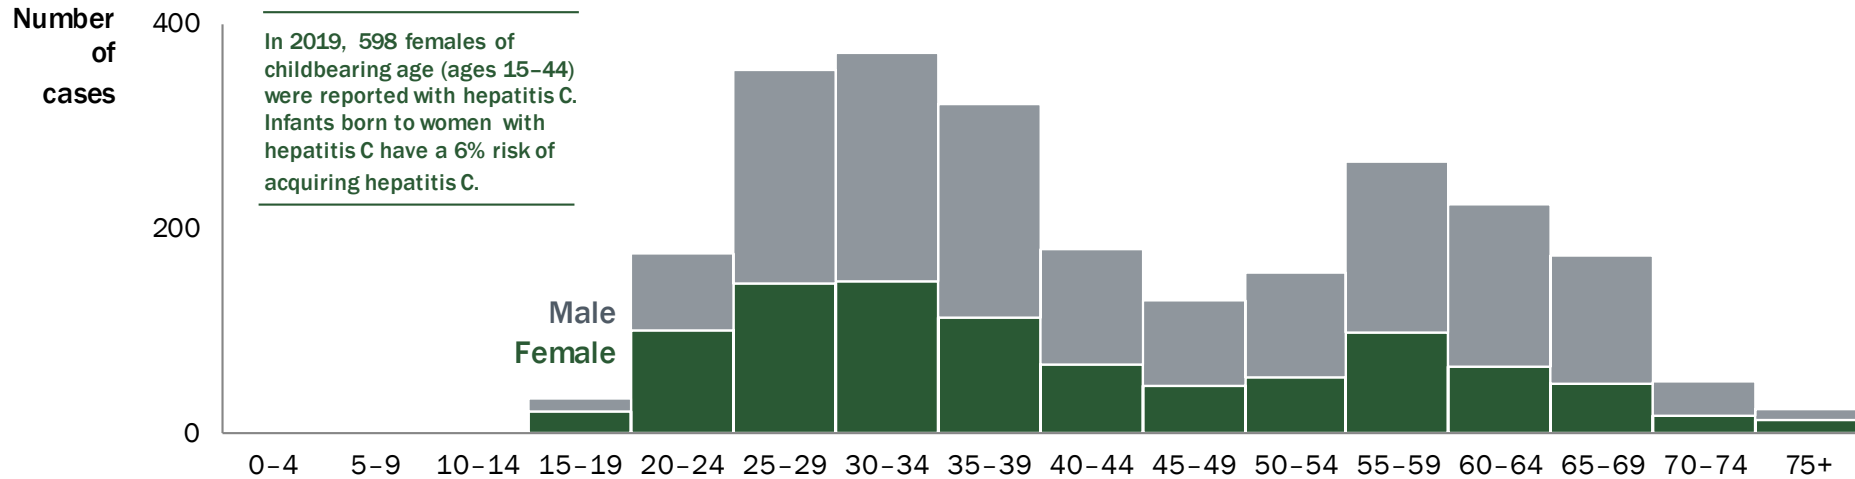

Over the past 10 years, the number of **newly reported hepatitis C cases among young people ages 15–29 has nearly doubled**, and more Wisconsin counties are reporting cases.

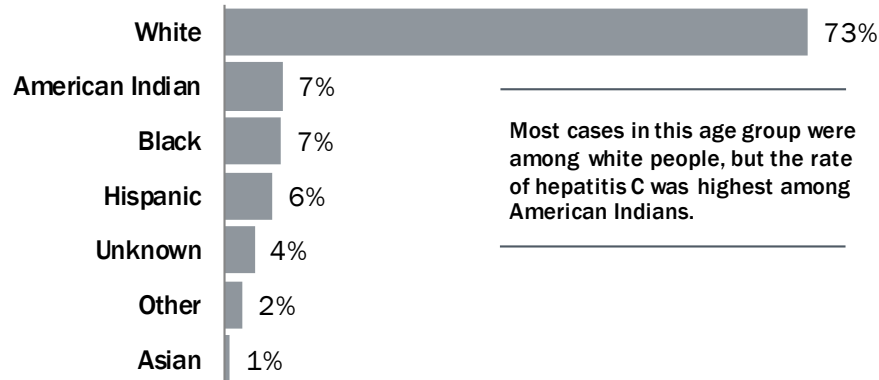

# Hepatitis C in 2019: Age, Sex, and Race

In 2019, newly reported hepatitis C cases were commonly reported among two groups: **young adults who were likely recently infected** and **older adults who were likely infected many years ago**.

## Young adults

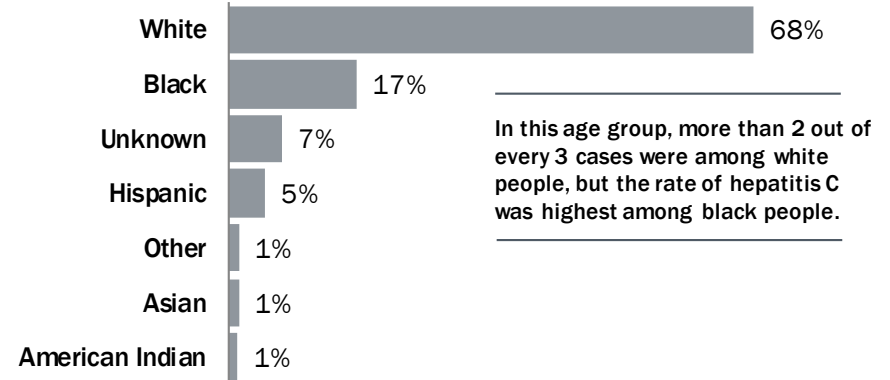

Percent of hepatitis C cases by race/ethnicity among people age 15–29, 2019

People who inject drugs are at high risk for hepatitis C, and injection drug use is the most commonly reported risk factor among this age group. Nearly half of cases ages 15–29 were female.

## Baby boomers

Percent of hepatitis C cases by race/ethnicity among people born 1945–1965, 2019

Most hepatitis C cases in the U.S. are among baby boomers and likely represent infections that occurred many years ago. Two out of three cases in this cohort were male.
