PFOS
(Perfluorooctane sulfonic acid)

If the combined level of PFOS, PFOA, FOSA, NETFOSA, NETFOSE and NETFOSAA in your drinking water is over 20 ng/L, you should find a different source of water.

What is PFOS?
PFOS is a chemical in a group of contaminants called per- and polyfluoroalkyl substances (PFAS).
- PFOS can be found in stain repellants in carpet and fabric, food and other packaging, and fire-fighting foam.
- People can be exposed to PFOS by drinking water, eating food, and breathing in or accidentally swallowing soil or dust containing PFAS.

Can PFOS affect our health?
Studies have shown that PFOS can affect the health of people and research animals.
- Studies among people have shown that high levels of PFOS are associated with increased cholesterol levels, pregnancy-induced hypertension, thyroid disease, decreased antibody response to vaccines, and decreased fertility in women.
- Studies in research animals have found that high levels of PFOS can affect the immune system, development, and liver.

What can you do to protect your health?
Wisconsin recommends a groundwater standard of 20 ng/L for PFOS, PFOA, NETFOSA, FOSA, NETFOSE, and NETFOSAA combined.
Find a different source of drinking water if the level of these PFAS in your water is over 20 ng/L. Sources of water can include:
- Water from a public water system or private well that has been tested for PFAS and has levels below Wisconsin’s recommended groundwater standards
- Bottled water that has been tested for PFAS and has levels below the recommended groundwater standards.

Looking for more information?
- See the Agency for Toxic Substances and Disease Registry website for more information on PFAS health effects.
- Visit the DHS website for more information on Wisconsin’s recommended groundwater standards.
