

HIV in Milwaukee

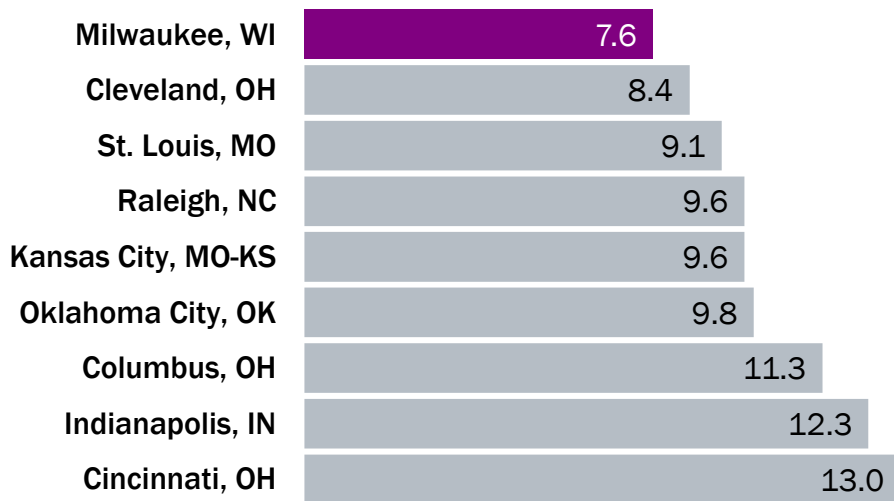

2019 Summary Report

HIV surveillance data provide important information for planning HIV prevention and care services. The data show trends and priority populations in order to focus resources. During 2019, 106 people were newly diagnosed with HIV in Milwaukee. Out of the 106 people, 23% were diagnosed at a community-based agency or health department. A total of 2,806 people live with HIV in Milwaukee. For more information, visit the full [Supplemental Report](#).

Milwaukee Comparisons

Milwaukee has the **lowest HIV diagnosis rate** compared to similar cities.

Estimated number of HIV diagnoses per 100,000 people by city, 2018

Although trends do not show a significant increase over time, these populations should be emerging priorities:

People who inject drugs

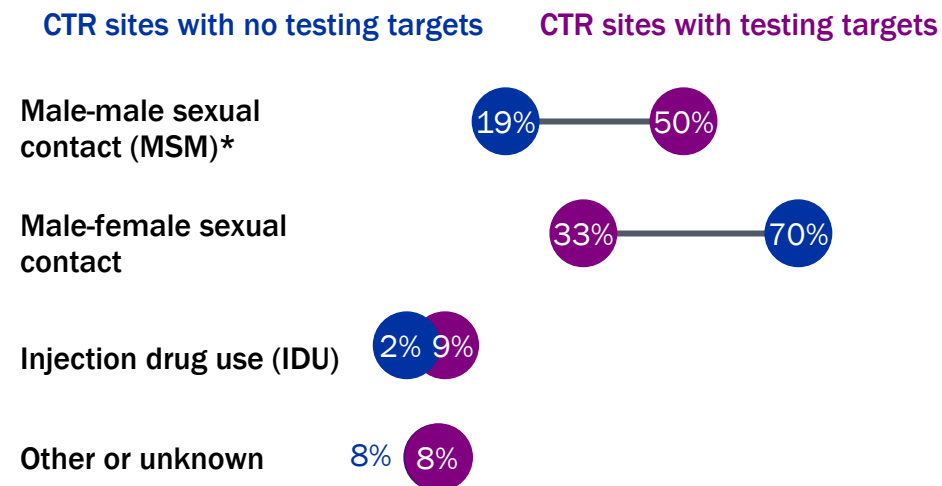

Young Hispanic MSM

15- to 19-year-olds

HIV Testing

Counseling, Testing and Referral (CTR) sites **with testing targets** provided more HIV tests among people with reported **MSM and IDU** risk than CTR sites without targets.

Percentage of CTR HIV test by self-reported exposure and CTR type, Milwaukee CTR sites, 2019

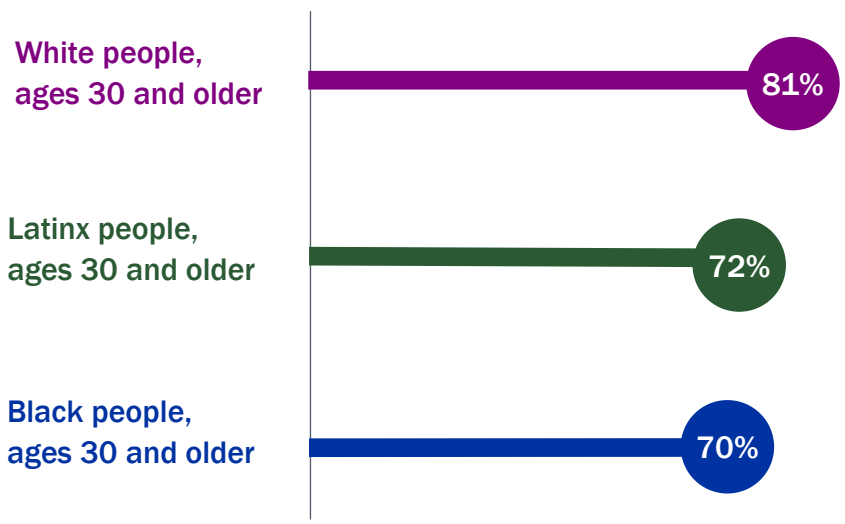

*Also includes those with reported risk of MSM and IDU

Care and Prevention

A lower percentage of people of color ages 30 and older are virally suppressed.*

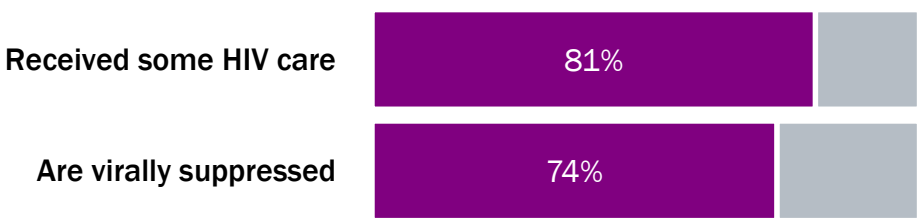

HIV Care Continuum - Care Outcomes, Milwaukee, 2019

*People whose last viral load test was prior to 2019 or who did not have a viral load test done in 2019 were considered to have unsuppressed viral loads.

Most people living with HIV received some HIV care and over half were virally suppressed.

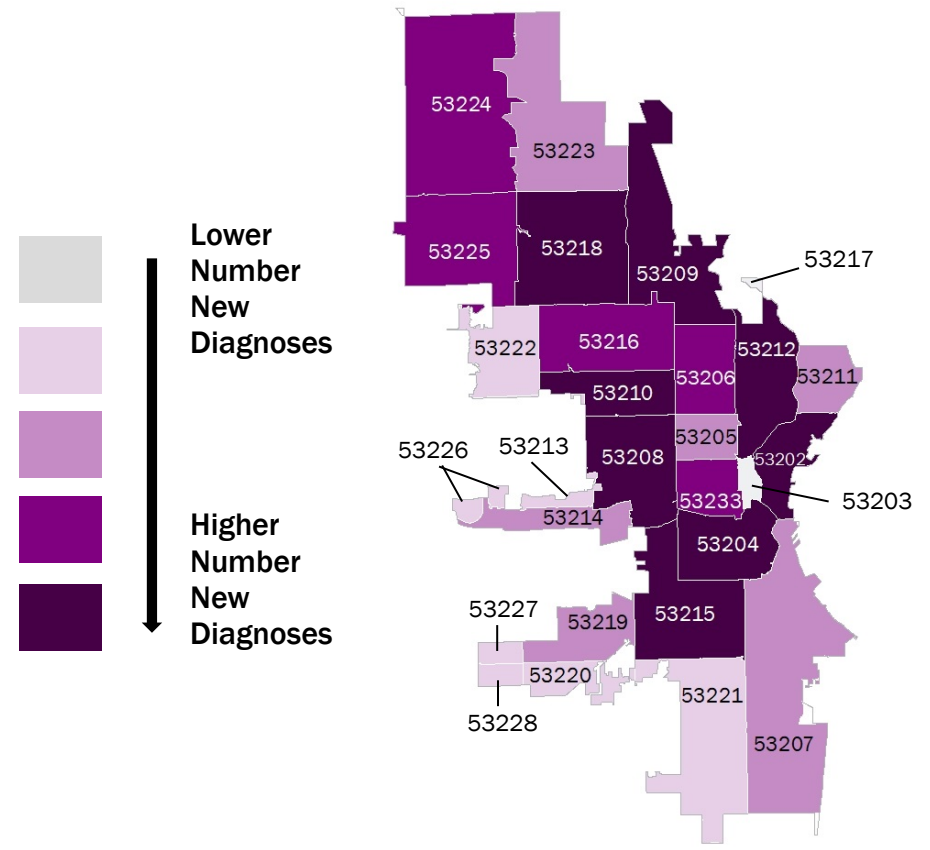

HIV Care Continuum - Retention and Care Outcomes, Milwaukee, 2019

HIV New Diagnoses, 2019

Eight Milwaukee zip codes account for 60% of new diagnoses during 2017–2019.

Geographic distribution of new HIV diagnoses, Milwaukee, 2017–2019

Among the 106 new HIV cases in 2019:

29 years
Median age

78%
Male
