Foreword

The Department of Health and Family Services is mandated by section 69.03 (9), Wisconsin Statutes, to prepare an annual report on vital statistics. This report summarizes data collected from the confidential portion of the birth record and related infant death information compiled from resident death certificates.

The Department of Health and Family Services produced this publication, which was prepared in the Bureau of Health Information and Policy, Division of Public Health.

In the Bureau of Health Information and Policy, staff of the Vital Records Section, Registration and Statistics Unit, collected and compiled the birth, infant death, and fetal death records. Laura Ninneman prepared the report and updated the narrative. Patricia Nametz edited the report. Draft review and comments were provided by Murray Katcher, M.D., Bureau of Community Health Promotion, Division of Public Health; and by Sandra Park in the Bureau of Health Information and Policy, Population Health Information Section. The report was prepared under the supervision of John Kiesow, State Registrar, Vital Records Section, and Jane Kraus, Supervisor, Registration and Statistics Unit; and the overall direction of Margaret Kristan, Director, Bureau of Health Information and Policy.

Additional health-related statistical information for Wisconsin is available through the Internet on the Department of Health and Family Services Web site, at <https://www.dhs.wisconsin.gov/stats/index.htm>. Wisconsin Interactive Statistics on Health (WISH) is a data query system that allows users to obtain birth and other data tailored to their specifications, at <https://www.dhs.wisconsin.gov/wish/index.htm>. Trend tables of maternal and child health data for individual counties are available at <https://www.dhs.wisconsin.gov/stats/births/index.htm>.

Comments, suggestions and requests for further information may be addressed to:

Introduction

This report presents information about births that occurred in 2005 to Wisconsin residents. Information from previous years is also presented to show changes over time. Information is included on the number and rate of live births; demographic characteristics of the mother, such as age, race, marital status, education and number of previous births; characteristics of the pregnancy and delivery, including the trimester that prenatal care began, number of visits, and whether the mother smoked during pregnancy; and characteristics of the newborn. Also included is information about infants who died before their first birthday, and fetuses of more than 20 weeks of gestation who were stillborn.

All data in this report refer to Wisconsin residents unless otherwise noted. In most tables, events have been assigned to the place where the person lives (usually legal residence), regardless of the place of the event. For births, the reference is to the residence of the mother. For deaths, the reference is to the residence of the infant.

The indicators included in this report have been selected based on their availability from birth and infant death records and their use in identifying health risks, as determined by national and international studies. The data files used are the Wisconsin resident birth certificate file, the matched birth-death file, and the fetal death file. The tables and graphics presented were designed to make these indicators easily accessible, while allowing users flexibility. Most tables include the frequencies of events or conditions, along with percentages or rates. In general, bar graphs show data for 2005 (and comparative information for 1995); line graphs show time trends, and vary in the years shown for comparison.

This year's report includes three additions. One new figure (Figure 3, page 7) shows birth rates by race/ethnicity; another new figure (Figure 16, page 24) shows trends in c-section rates; and the final new figure (Figure 23, page 31) shows disparity ratios between African American and white mothers for infant mortality, low birthweight, and very low birthweight.

Chapter 69 of the Wisconsin Statutes mandates the Department of Health and Family Services to supervise and direct the collection of birth data from hospitals and birth attendants. State law also requires the Department to protect the confidentiality of birth data, and to ensure that statistical information based on the data (such as that contained in this report) does not identify any individual. The Bureau of Health Information and Policy in the Department of Health and Family Services scrupulously follows written procedures to protect the confidential data entrusted to it.

The National Center for Health Statistics works with representatives of all 50 states to select the specific data items collected on the birth record. Data items are chosen for their usefulness in understanding and improving maternal and child health outcomes.

The Bureau of Health Information and Policy acknowledges and thanks the Wisconsin hospitals and birth attendants who reported birth information, and their counterparts in neighboring states who submitted out-of-state birth data for Wisconsin residents.

Key Findings

- In 2005, there were 70,934 live births to Wisconsin residents, 804 more than in 2004.
- The 2005 crude birth rate in Wisconsin was 12.7 births per 1,000 total population, the same as the 2004 rate. In comparison, the United States crude birth rate for 2003 was 14.1 per 1,000 population. (The crude birth rate is the number of live births per 1,000 total population.)
- The 2005 general fertility rate of 61.2 births per 1,000 Wisconsin females aged 15-44 was lower than the 2003 United States general fertility rate of 66.1 births per 1,000 (see Technical Notes, page 105, for source of U.S. data).
- In 2005, the fertility rate for Wisconsin teens aged 15-19 was 30.5 births per 1,000 females in this age group. This was the same as the rate in 2004. In 2003, the U.S. teen fertility rate was 41.6.
- Wisconsin age-specific fertility rates are lower than the corresponding national rates for teens, women aged 20-24 and women aged 35 and older. Age-specific fertility rates for women aged 25-29 and 30-34 are higher than corresponding national rates (see page 5 of this report).
- From 1995 to 2005, the percent of births to women in their early teens and early thirties decreased, while the percent of births to women in their early twenties and aged 35-39 increased. The proportion of births to women in their late teens, late twenties, and mothers aged 40-plus remained the same.
- From 1995 to 2005, the proportion of Wisconsin births to non-Hispanic white women decreased from 82 percent to 77 percent, while the proportion of births to Hispanics increased from 4 percent to 9 percent. The proportion of births to women in other race/ethnicity groups remained roughly stable, with black women accounting for 10 percent in 1995 and 10 percent in 2005, American Indian women approximately 1 percent in each year, and women in other groups approximately 3 to 4 percent in each year.
- In 2005, 16 percent of Wisconsin women who gave birth had not finished high school, unchanged from 1995. Fifty-five percent of women who gave birth in 2005 had attended college for one year or more, compared to 50 percent in 1995.
- The overall proportion of women who received first-trimester prenatal care was 85 percent in 2005, compared with 83 percent in 1995. The proportion with first-trimester care increased in each age group and each race/ethnicity group, with the exception of mothers under 15 years of age and mothers aged 15-17.
- The proportion of women giving birth who reported they smoked during pregnancy decreased from 19 percent in 1995 to 13 percent in 2005.
- In 2005, 4,992 Wisconsin infants were low birthweight; that is, they weighed less than 2,500 grams (about 5.5 pounds) at birth. This total represented 7.0 percent of all births (the same as 2004). In comparison, 7.9 percent of all infants born in the United States in 2003 weighed less than 2,500 grams.
- Among low birthweight infants, 925 were born at *very* low birthweight (less than 1,500 grams or about 3.3 pounds) and were thus at the highest risk for health problems. The very low birthweight percentage was 1.3 percent among all births, and 1.0 percent of births to whites, 3.5

percent of births to blacks, 1.3 percent of births to American Indians, 1.3 percent of births to Hispanics and 1.2 percent of births to Laotian/Hmong.

- In 2005, 8,033 Wisconsin infants were born prematurely (with a gestation of less than 37 weeks). This total represented 11.3 percent of all births (compared to 11.0% in 2004). (See Technical Notes, page 106, for full definition of prematurity.)
- In Wisconsin, 469 infants under the age of one year died in 2005. The 2005 infant mortality rate was 6.6 infant deaths per 1,000 live births, compared to 6.0 in 2004 and 7.3 in 1995. The 2003 U.S. infant mortality rate (the latest available) was 6.8 infant deaths per 1,000 live births.
- The black infant mortality rate for 2005 was 15.0 deaths per 1,000 births to black mothers, compared to 19.2 in 2004 and 17.9 in 1995. The 2005 white infant mortality rate was 5.6 deaths per 1,000 births to white women, compared to 4.5 in 2004 and 6.2 in 1995. The Hispanic infant mortality rate for 2005 was 6.7 deaths per 1,000 births to Hispanic women, compared to 5.1 in 2004 and 8.8 in 1995.
- Based on three-year rolling average infant mortality rates (Figure 22), American Indian infant mortality has dropped markedly since 1984. The rate was 19.6 per 1,000 live births in 1984-1986 and 7.5 per 1,000 in 2003-2005. The African American infant mortality rate has remained much higher than the rate for other populations in Wisconsin for two decades. The three-year average rate was 18.4 per 1,000 live births in 1984-1986, and 16.5 in 2003-2005. The Hispanic infant mortality rate fluctuated but remained essentially unchanged; it was 6.4 per 1,000 live births in 1984-1986 and 6.2 per 1,000 in 2003-2005. Total infant mortality and white infant mortality declined gradually over the 1984-2005 period.
- The black-white disparity ratio for infant mortality has increased over the past 15 years. The black infant mortality rate was 2.2 times the white rate in 1990-1992, and 3.2 times the white rate in 2003-2005 (Figure 23).

Ten Most Popular First Names for Newborns, Wisconsin 2005		
Females		Males
1.	Emma	1. Ethan
2.	Olivia	2. Jacob
3.	Emily	3. Tyler
4.	Ava	4. Alexander
5.	Grace	5. Logan
6.	Abigail	6. Samuel
7.	Hannah	7. Benjamin
8.	Madison	8. Andrew
9.	Ella	9. Mason
10.	Elizabeth	10. Joshua

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: This ranking counts each spelling as a separate name. The list would change somewhat if different spellings were grouped together and counted as one name. For example, counting Kaitlyn, Katelyn, Caitlin, Caitlyn and Kaitlin as one name could change the placements.

Birth and Fertility Rates

- In 2005 there were 70,934 births to Wisconsin residents, 804 more than in 2004 (Figure 1).
- The 2005 crude birth rate was 12.7 births per 1,000 population (Table 2-1), the same as the 2004 rate. In comparison, the United States crude birth rate for 2003 was 14.1 births per 1,000 population. (The crude birth rate is the number of live births per 1,000 total population.)
- The 2005 general fertility rate of 61.2 births per 1,000 Wisconsin females ages 15-44 (Table 2-1) was higher than the 2004 rate (60.3). In comparison, the United States general fertility rate for 2003 was 66.1 births per 1,000.

Figure 1. Number of Births to Wisconsin Residents, 1910-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: A live birth is the complete expulsion or extraction from his or her mother, of a human being, at any stage of development, who, after the expulsion or extraction, breathes or has a beating heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, regardless of whether the umbilical cord has been cut, and regardless of whether the expulsion or extraction occurs as a result of a natural or induced labor, a cesarean section, or an abortion. Unless otherwise noted, all births referred to in this report are live births to Wisconsin residents.

Due to a reporting error, the total number of births to Wisconsin residents in 2004 was reported as 70,131. The total number of births to Wisconsin residents should have been reported as 70,130. This error was discovered after the 2004 report was published.

- Wisconsin age-specific fertility rates are lower than the corresponding national rates for teens, women aged 20-24 and women aged 35 and older (Table 1-1). Age-specific fertility rates are the number of births to a specific age group per 1,000 females in that age group.
- Fertility rates among Wisconsin women aged 25-29 and 30-34 are higher than the corresponding national rates, based on United States 2003 final statistics (Table 1-1). (See Technical Notes, page 105, for source of U.S. data.)

Table 1-1. Age-Specific Fertility Rates, Wisconsin, 2005 and United States, 2003

Age	Wisconsin Rate		U.S. Rate
15-19	30.5	(30.1)*	41.6
15-17	15.6	(14.9)*	22.4
18-19	52.5		70.7
20-24	81.5		102.6
25-29	119.4		115.6
30-34	104.1		95.1
35-39	42.4		43.8
40-44	7.3	(7.0)*	8.7

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Rates are the number of births per 1,000 females in the age group. Wisconsin rates for births to mothers ages 15-19 and 15-17 include 86 births to mothers less than 15 years old; the rate for mothers aged 40-44 includes 75 births to mothers aged 45 or older. U.S. rates for ages 15-19 and 15-17 do not include births to mothers less than 15 years old; the U.S. rate for ages 40-44 does not include births to mothers aged 45 or older.

* Wisconsin rates in parentheses are calculated to be comparable to U.S. rates, which exclude mothers younger than 15 and mothers older than 44 from the calculations.

- Compared with 1990 (Figure 2), age-specific fertility rates in 2005 were:
 - Lower for teens, women aged 20-24, and women aged 25-29.
 - Higher for women aged 30-34 and 35-plus.

Figure 2. Age-Specific Fertility Rates, Wisconsin, 1990-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The fertility rate for Wisconsin females ages 15-19 is based on that age-specific population but includes births to mothers less than 15 years old. The fertility rate for females aged 40-44 is based on that age-specific population but includes births to mothers aged 45 and older.

- Race/ethnicity-specific birth rates (births per 1,000 females aged 15-44 in a race/ethnicity group) have decreased since 1990 for whites, African Americans, and Asians.
- The overall birth rate (also called the general fertility rate) also decreased, from 64.5 to 61.2 per 1,000 females aged 15-44.
- The African American and Asian birth rates decreased most dramatically. The African American rate decreased from 107.0 births per 1,000 African American females aged 15-44 in 1990 to 77.4 per 1,000 in 2005, a decline of 28 percent.
- The Asian birth rate also decreased 28 percent, from 113.6 to 81.5 per 1,000 Asian females aged 15-44.
- The white birth rate decreased from 60.5 to 56.0 per 1,000 white females aged 15-44.
- The American Indian birth rate has stayed fairly stable over the past 15 years. In 2005, it was 88.1 per 1,000 American Indian females aged 15-44 (83.9 in 1990).
- In contrast to trends in other groups, the Hispanic birth rate has gradually increased since 1990. In 2005, the Hispanic birth rate was 103.6 per 1,000 Hispanic females aged 15-44.

Figure 3. Birth Rates by Race/Ethnicity, 1990-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories. The birth rate for Wisconsin females by race is based on bridged race estimates from the US Census Bureau. Because individuals could report more than one race for the first time during the 2000 Census, rates for earlier years are not directly comparable to those for 2000 and later.

Population estimates, especially in relatively small and fast-growing populations, become less reliable with every year that passes after the Census on which they are based. This can affect the reliability of rates for some populations. Rates by race/ethnicity in the latter half of the decade should thus be viewed with caution.

These rates may not match previously published rates due to updates in the population estimates by race/ethnicity.

- In 2005, the fertility rate for Wisconsin teens aged 15-19 was 30.5 births per 1,000 females in this age group (Figure 2). This was the same as the rate in 2004. Over the last decade, there has been a general decline in the teen fertility rate.
- For many years the Wisconsin teen fertility rate has been lower than the comparable national rate. In 2003, the U.S. teen fertility rate was 41.6.

Figure 4. Teen Birth Rates, Wisconsin, 1980-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Fertility rates for ages 15-17 and 15-19 are based on these age-specific populations, but include births to mothers younger than 15 years old.

Characteristics of the Mother

Age of Mother

Births in 2005 included:

86	births to teens less than 15 years old
1,776	births to teens 15-17 years old
4,231	births to teens 18-19 years old
16,430	births to women aged 20-24
21,305	births to women aged 25-29
17,387	births to women aged 30-34
8,070	births to women aged 35-39
1,564	births to women aged 40-44
75	births to women aged 45 or older
10	births with unreported maternal age.

- From 1995 to 2005, the percent of births to women in their early teens and early thirties decreased, while the percent of births to women in their early twenties and late thirties increased. The proportion of births to women in their late teens, late twenties, and aged 40-plus remained the same (Figure 5).

Figure 5. Percent of Births by Age of Mother, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: For detailed information on 2005 births by age of mother, see Tables 4-1 and 4-2, pages 90 and 91.

Births to Teens

- The majority of births to teens (under 20 years of age) were to older teens, aged 18-19. This was also true in 1995 (Table 1-2).

Table 1-2. Teen Births by Age, Wisconsin, 1995 and 2005

Maternal Age (Teens)	1995		2005	
	Number	Percent	Number	Percent
<15	182	3%	86	1%
15-17	2,549	36	1,776	29
18-19	4,379	62	4,231	69
Total <20	7,110	100%	6,093	100%

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Percents may not add to 100 due to rounding.

- Non-Hispanic whites make up the largest number of teen births in the state (3,179 in 2005) (Table 1-3).
- Teen births represented 8.6 percent of all births, and a higher proportion of births to blacks, American Indians, Hispanics, and Laotian/Hmong (Table 1-3).

Table 1-3. Teen Births by Race/Ethnicity, Wisconsin, 2005

Race/Ethnicity	Number of Births		Percent of Births		
	Total	Teens (<20)	Teens (<20)	Ages 20+	Total
Total	70,934	6,093	8.6%	91.4%	100.0%
White	54,292	3,179	5.9	94.1	100.0
Black/African American	6,715	1,563	23.3	76.7	100.0
American Indian	1,039	194	18.7	81.3	100.0
Hispanic/Latino	6,262	870	13.9	86.1	100.0
Laotian/Hmong	1,101	213	19.3	80.7	100.0
Other	1,495	73	4.9	95.1	100.0

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Included in the total are 30 births for which race/ethnicity of mother was not reported; 1 of these was to a mother under 20 years of age. See Technical Notes (page 105) for definition of race/ethnicity categories.

- In 2005 compared to 1995, teen births represented a smaller proportion of births to whites (6 percent vs. 8 percent), African Americans (23 percent vs. 29 percent), American Indians (19 percent vs. 21 percent), and Hispanics (14 percent vs. 22 percent) (Figure 6).

Figure 6. Teen Births as a Percent of Total Births in Each Race/Ethnicity Group, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories.

- In 2005, 10 percent of teen births occurred less than 24 months since a previous birth. Seven percent of teen births occurred 24 or more months since a previous birth, and 82 percent were first births (Table 1-4).

Table 1-4. Teen Births by Interval in Months Since Last Live Birth, Wisconsin, 2005

Birth Interval	All	All Teens			All	All Teens		
	Ages	(<20)	<18	18-19	Ages	(<20)	<18	18-19
Total	70,934	6,093	1,862	4,231	100.0%	100.0%	100.0%	100.0%
First Birth	27,784	4,975	1,688	3,287	39.2	81.7	90.7	77.7
1-11 Months	642	70	17	53	0.9	1.1	0.9	1.3
12-17 Months	3,808	293	53	240	5.4	4.8	2.8	5.7
18-23 Months	5,930	238	40	198	8.4	3.9	2.1	4.7
24-Plus Months	29,604	402	42	360	41.7	6.6	2.3	8.5
Unknown	2,014	69	11	58	2.8	1.1	0.6	1.4
Plural Delivery	1,152	46	11	35	1.6	0.8	0.6	0.8

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: Included in the total for all ages are 10 births for which age of mother was not reported. The “plural delivery” row includes those births in each multiple birth that are second or later birth position. For example, in a twin delivery, the first-born twin is included in the birth interval distribution (months since last live birth) and the second-born twin is included in the “plural delivery” row.

Race/Ethnicity of Mother

- In 2005, 54,292 births (76.5%) were to non-Hispanic white women (Table 1-5). This percentage has gradually declined in recent decades (it was 82.1% in 1995).
- 6,715 births (9.5%) were to non-Hispanic black women (Table 1-5). The percent of births to black women has been fairly stable since 1995.
- 1,039 births (1.5%) were to American Indian women (Table 1-5). This proportion has been stable for the past decade.
- 6,262 births (8.8%) were to Hispanic women (Table 1-5). This is double the proportion of Hispanic births in 1995 (4.2%).
- 1,101 births (1.6%) were to Laotian/Hmong women, similar to the 1995 percentage (1.7%).
- An additional 1,495 births (2.1%) were to women in other racial/ethnic groups (mostly Asian).

Table 1-5. Number and Percent of Births by Race/Ethnicity, Wisconsin, 1995 and 2005

	1995		2005	
	Number	Percent	Number	Percent

Figure 6. Percent of Births by Race/Ethnicity of Mother, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories. For detailed information on 2005 births by race/ethnicity of mother, see Tables 4-3 and 4-4, pages 92-95. Percents may not add to 100 due to rounding.

Marital Status of Mother

- In 2005, 33 percent of births were to unmarried women, compared with 27 percent in 1995 (Figure 8).
- In general, the percent of births to mothers who are unmarried decreases with age. Eighty-three percent of those aged 18-19 giving birth in 2005 were unmarried, compared with only 13 percent of those aged 30-34 (Figure 8).
- Between 1995 and 2005, the unmarried percentage increased in every maternal age group (Figure 8). The largest increase occurred among mothers aged 20-24 (from 46% to 58%—12 percentage points).

Figure 8. Percent of Births to Unmarried Mothers, by Age, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

- From 1995 to 2005, the percent of non-marital births increased among whites, American Indians, Hispanics, Laotian/Hmong, and the “other” group, and decreased slightly among blacks (Figure 9).
- The Wisconsin percent of births to unmarried mothers in 2005 (33%) was lower than the national percent (35%). However, the percent of births to unmarried mothers was higher in Wisconsin than nationally among blacks (82% vs. 69%) and Hispanics (49% vs. 45%).

Figure 9. Percent of Births to Unmarried Mothers, by Race/Ethnicity, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories.

Education of Mother

- In 2005, 16 percent of women who gave birth had not finished high school, the same proportion as in 1995 (Figure 10). By age, the percentages with less than a high school education in 2005 were:

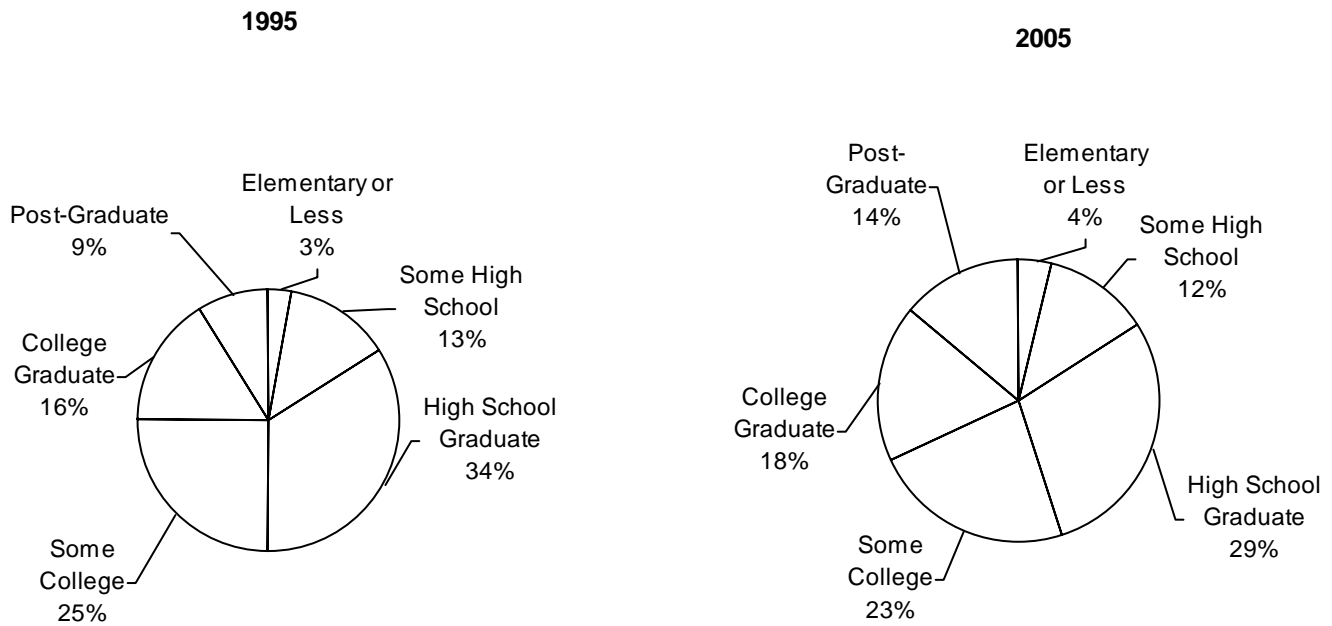

- 91% among mothers less than 18
- 37% among mothers 18-19
- 22% among mothers 20-24
- 10% among mothers 25-29
- 6% among mothers 30-34
- 7% among mothers 35-39
- 9% among mothers 40 or older

- On average, mothers in minority race/ethnicity groups were less likely to have completed high school. In 2005, the proportions of births to women with less than a high school education were:

- 9% among whites
- 35% among blacks
- 26% among American Indians
- 51% among Hispanics
- 30% among Laotian/Hmong
- 8% among other race/ethnicity groups

- Fifty-five percent of women who gave birth in 2005 had attended college for one year or more (Figure 10). The comparable percentage in 1995 was 50 percent.

Figure 10. Percent of Births by Education of Mother, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: “Some High School” or “Some College” means the mother completed at least one year of schooling at that level. For detailed information on 2005 births by education of mother, see Tables 4-1 through 4-5, pages 90-97 . Percents may not add to 100 due to rounding.

Characteristics of the Pregnancy and Delivery

Prenatal Care

- The overall proportion of women who received first-trimester prenatal care was 85 percent in 2005, compared with 83 percent in 1995 (Figure 11).
- In 2,053 births in 2005, the mother either did not begin prenatal care until the third trimester of pregnancy (1,623 births) or received no care at all (430 births) (Table 2-22). These births with “late or no prenatal care” constituted 2.9 percent of all births (down from 3.4 percent in 1995).
- In almost every age group, mothers were more likely to receive first-trimester care in 2005 than in 1995 (Figure 11).
- The percent of Wisconsin women who received first-trimester prenatal care in 2005 (85%) was slightly higher than the 2003 national figure (84%).

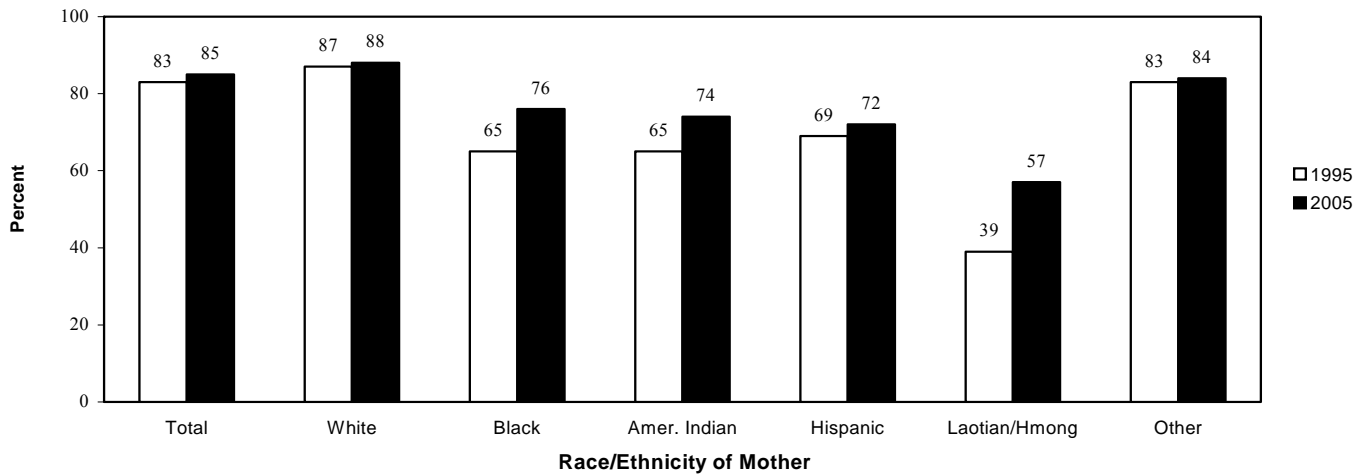

Figure 11. Percent of Births to Mothers Who Received First-Trimester Prenatal Care, by Age, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

- From 1995 to 2005, the proportion of women receiving first-trimester care increased within each race/ethnicity group. The increase was especially striking among African American, American Indian and Laotian/Hmong women (Figure 12).

Figure 12. Percent of Births to Mothers Who Received First-Trimester Prenatal Care, by Race/Ethnicity, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories.

Cigarette Smoking

- Smoking during pregnancy poses risks for fetal development and infant health. Maternal smoking is associated with low birthweight in two ways: it slows fetal growth during gestation and increases the risk of a premature birth.
- The proportion of women who reported they smoked during pregnancy decreased from 19 percent in 1995 to 13 percent in 2005 (Figure 13).
- From 1995 to 2005, smoking during pregnancy declined in each maternal age group (Figure 13).

Figure 13. Percent of Births to Mothers Who Reported Smoking Cigarettes During Pregnancy, by Age, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: For detailed information on 2005 births by smoking behavior during pregnancy, see Tables 4-1 through 4-5, pages 90-97.

- From 1995 to 2005, the percentage of mothers who reported smoking during pregnancy declined in most race/ethnicity groups (Figure 14). The only exception was found among Laotian/Hmong women.
- No data are presented on mother’s self-reported use of alcohol during pregnancy because this item appears to be under-reported on the birth reporting form. This conclusion is based on the inconsistency between birth certificate data (1.0% of mothers reported drinking during pregnancy in 2005) and the 2005 Behavioral Risk Factor Survey (66% of Wisconsin women aged 18-44 reported drinking within the past month).

Figure 14. Percent of Births to Mothers Who Reported Smoking Cigarettes During Pregnancy, by Race/Ethnicity, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 105) for definition of race/ethnicity categories. For detailed information on 2005 births by smoking behavior during pregnancy, see Tables 4-1 through 4-5, pages 90-97.

Medical Risk Factors

The most frequently reported maternal medical risk factors reported for 2005 births were hypertension (reported in 6.0 percent of births), sexually transmitted diseases (5.5 percent), diabetes (4.5 percent), lung disease (4.0 percent), anemia (2.9 percent), and a previous preterm or small-for-gestational age infant (2.9 percent) (Table 1-6).

Table 1-6. Births with Reported Medical Risk Factors, Wisconsin, 2005

	Number	Percent
Sexually Transmitted Diseases	3,874	5.5%
Hypertension	4,249	6.0
Pregnancy-Associated	3,496	4.9
Chronic	753	1.1
Diabetes	3,186	4.5
Gestational	2,770	3.9
Pre-Existing	416	0.6
Anemia	2,058	2.9
Lung Disease, Acute or Chronic	2,860	4.0
Previous Preterm/Small for Gestational Age Infant	2,030	2.9
Previous Large Infant (4,000+ grams)	1,371	1.9
Uterine Bleeding	649	0.9
Cardiac Disease	631	0.9
Hydramnios/Oligohydramnios	722	1.0
Renal Disease	414	0.6
Rh Sensitization	381	0.5
Eclampsia	169	0.2
Incompetent Cervix	197	0.3
Hemoglobinopathy	204	0.3
Any Reported	33,727	47.5

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: See Technical Notes (page 107) for definitions of maternal medical risk factors. Since more than one medical risk factor may be indicated for each birth, and since conditions in the “other” checkbox are not reported in this table, columns will not sum to the “any reported” line.

Figure 15. Percent of Births with Selected Maternal Medical Risk Factors, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Methods of Delivery

In 2005, the following methods of delivery were reported:

Vaginal (no previous C-section)	52,416	73.9%
Primary C-Section	9,930	14.0
Repeat C-Section	6,870	9.7
Vaginal After Previous C-Section (VBAC)	917	1.3
Forceps	800	1.1
Other	1	0.0
Total	70,934	100.0%

Figure 16. Cesarean Sections as a Percent of All Births, 1990-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Obstetric Procedures

In 2005, births with reported obstetric procedures included:

Electronic fetal monitoring	60,950	85.9%
Ultrasound	47,665	67.2
Induction of labor	17,018	24.0
Stimulation of labor	16,751	23.6
Amniocentesis	566	0.8
Postpartum sterilization	2,112	3.0
Tocolysis	1,426	2.0
Other procedures	15	0.0
Births With Reported Procedure(s)	67,731	95.5

Notes: See Technical Notes (page 108) for definitions of obstetric procedures. Each birth could have more than one type of procedure reported.

Figure 17. Percent of Births with Obstetric Procedures Reported, Wisconsin, 1995 and 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Characteristics of the Newborn

Low Birthweight

- In 2005, 4,992 Wisconsin infants were low birthweight; that is, they weighed less than 2,500 grams (about 5.5 pounds) at birth (Table 2-26). This total represented 7.0 percent of all births (compared to 7.0 percent in 2004). In comparison, 7.9 percent of all infants born in the United States in 2003 weighed less than 2,500 grams.
- Among these low birthweight infants, 925 were born at *very* low birthweight (less than 1,500 grams or about 3.3 pounds) and were thus at the highest risk for health problems (Table 2-26). The very low birthweight percentage was 1.3 percent among all births, and 1.0 percent of births to whites, 1.3 percent of births to Hispanics, 3.5 percent of births to blacks, 1.3 percent of births to American Indians, and 1.2 percent of births to Laotian/Hmong (Table 4-5).
- Compared with the overall incidence of low birthweight in 2005 (7.0 percent), higher percentages of low-birthweight infants were born to (Table 4-5):
 - Mothers who received no prenatal care (22.6 percent),
 - Mothers less than 15 years old (14.0 percent),
 - Non-Hispanic black women (13.7 percent),
 - Women who smoked during pregnancy (11.4 percent),
 - Women who were unmarried (9.3 percent),
 - Women with less than a high school education (9.3 percent).
- From 1995 to 2005, the low birthweight percentage among infants born to mothers less than 18 years of age fluctuated from a low of 9.0 percent in 1996 to a high of 11.7 percent in 1998. In 2005, this percentage was 10.6 (compared with 6.9 percent among mothers age 18 and older).
- Forty-two percent of premature infants were of low birthweight (Table 4-5).
- Twins or other multiple births made up 25.9 percent of all low-birthweight births in 2005.

Figure 18. Percent of Births at Low Birthweight (< 2,500 grams), Wisconsin, 1995-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Prematurity

- In 2005, 8,033 Wisconsin infants were born prematurely (with a gestation of less than 37 weeks) (Table 4-1). This total represented 11.3 percent of all births (an increase from 11.0% in 2004). (See Technical Notes, page 106, for full definition of prematurity.)
- Compared with the overall proportion of premature infants in 2005 (11.3 percent), higher percentages of premature infants were born to:
 - Non-Hispanic black women (17.9 percent),
 - Teenagers less than 18 years old (16.5 percent),
 - Women who were unmarried (13.7 percent),
 - Women who smoked during pregnancy (13.7 percent),
 - Women with less than a high school education (13.2 percent),
 - Laotian/Hmong women (11.6 percent).
- Sixty-eight percent of low birthweight infants (birthweight under 2,500 grams) were premature.
- Twins or other multiple births made up 17.4 percent of all premature births in 2005. From 1995 to 2005, multiple births increased from 2.6 percent to 3.2 percent of all births.
- Prematurity increased from 9.8 percent of all births in 1995 to 11.3 percent of all births in 2005 (Figure 19).
- Prematurity among infants born to mothers less than 18 years of age was 16.5 percent in 2005, higher than the 1995 percent (15.3) (Figure 19). The prematurity rate among infants born to mothers 18 and older was 11.2 percent in 2005.

Figure 19. Percent of Premature Births, Wisconsin, 1995-2005

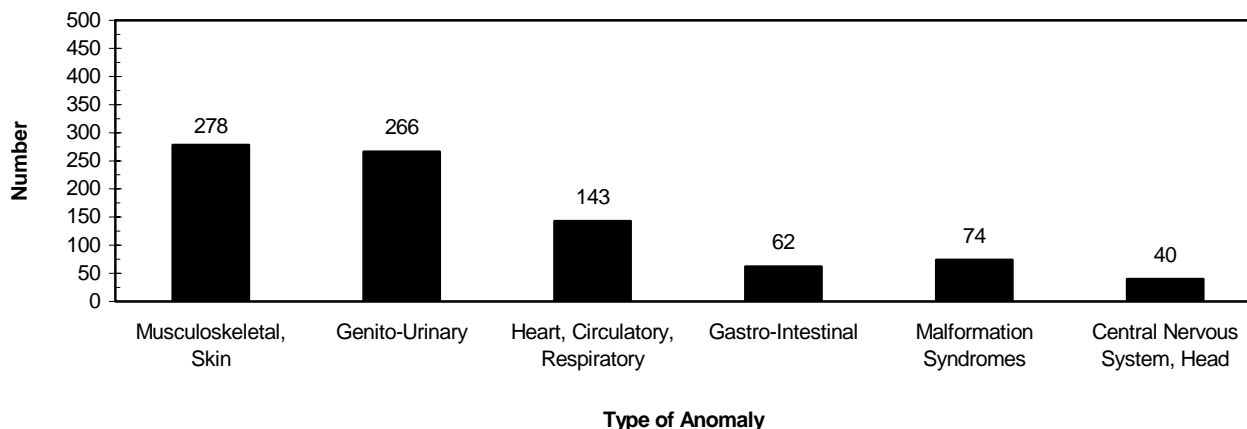

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: ‘Premature’ means less than 37 weeks of gestation. Since 1980, gestational age has been calculated as the difference between the date of last normal menses and the date of delivery. Since 1993, clinical estimate of gestation has been substituted where date of last normal menses is unknown. In 2004, if the date of last normal menses was unknown or invalid or the computed estimate of gestational age was less than 16 weeks or greater than 45 weeks, then the clinical estimate of gestation was used. Data for 1994-2003 shown on this page were recalculated to make them comparable with data for 2004 and subsequent years, and differ from previously published data.

Congenital Anomalies

Figure 20. Number of Reported Congenital Anomalies, Wisconsin 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Table 1-7. Reported Congenital Anomalies, Wisconsin 2005

Total Births With Reported Anomalies	916	Genito-Urinary	266
		Malformed Genitalia	153
Central Nervous System, Head	40	Renal Agenesis	27
Anencephalus	9	Other Urogenital	89
Spina Bifida/Meningocele	12	Musculoskeletal/Skin	278

Other Central Nervous System	16	Club Foot	50
Heart, Circulatory, Respiratory	143	Diaphragmatic Hernia	2
Heart Malformations	104	Other Musculoskeletal/ Integumental	83
Other Circulatory/Respiratory	44	Malformation Syndromes	74
Gastro-Intestinal	62	Down Syndrome	49
Rectal Atresia, Stenosis	14	Other Chromosomal	25
Tracheo-Esophageal Fistula	10	All Other	125
Omphalocele, Gastroschisis	21		
Other Gastrointestinal	19		

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: These numbers reflect only those congenital anomalies that can be discerned at birth and are reported on the birth certificate. Many are not detected before the newborn is discharged from the hospital. Since more than one anomaly may be reported for each infant, the columns do not add to total. This table is not comparable with congenital anomalies data published prior to 1989; see Technical Notes for explanation.

Mortality

- In Wisconsin, 469 infants under the age of one year died in 2005 (Table 2-28). The 2005 infant mortality rate was 6.6 infant deaths per 1,000 live births, compared to 6.0 in 2004 and 7.3 in 1995 (Figure 21). The 2003 U.S. infant mortality rate (the latest available data) was 6.8 infant deaths per 1,000 live births.
- There were 319 neonatal deaths (deaths of infants less than 28 days of age) in 2005, accounting for 68 percent of total infant deaths that year. The neonatal mortality rate in 2005 was 4.5 neonatal deaths per 1,000 live births, compared with 4.0 in 2004 and 4.6 in 1995 (Figure 21). In the U.S. in 2003 (the latest available data), the neonatal mortality rate was 4.6 per 1,000 live births.
- The fetal death rate (fetal deaths per 1,000 live births and fetal deaths) was 5.1 in 2005 (Figure 21). In comparison, the fetal death rate for 1995 was 5.9 per 1,000. (For the definition of “fetal death,” see Technical Notes, page 106.)
- Infants born to teenagers are at a higher risk of death than infants born to older mothers. In 2005, the infant mortality rate was 12.3 per 1,000 births among infants born to mothers aged less than 20, compared with 6.1 per 1,000 among infants born to women aged 20 and older.
- There were 15 maternal deaths in 2005; these are deaths attributed to pregnancy-related health conditions or events of delivery.

Figure 21. Infant, Neonatal, and Fetal Mortality Rates, 1970-2005

Source: Resident birth certificates, matched birth-death file, and fetal death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: An infant death is one that occurs before one year of age. The infant death rate is the number of resident infant deaths divided by total resident live births times 1,000. For detailed information on 2005 infant, neonatal and fetal deaths, see Table 4-8, pages 100-101.

- The black infant mortality rate for 2005 was 15.0 deaths per 1,000 births to black mothers, compared to 19.2 in 2004 and 17.9 in 1995. The 2005 white infant mortality rate was 5.6 deaths per 1,000 births to white women, compared to 4.5 in 2004 and 6.2 in 1995. The Hispanic infant mortality rate for 2005 was 6.7 deaths per 1,000 births to Hispanic women, compared to 5.1 in 2004 and 8.8 in 1995. The number of American Indian infant deaths in any single year was too small to present a rate.
- Based on three-year rolling average infant mortality rates (Figure 22), American Indian infant mortality has dropped markedly since 1984. The rate was 19.6 per 1,000 live births in 1984-1986 and 7.5 per 1,000 in 2003-2005.
- The African American infant mortality rate has remained much higher than the rate for other populations in Wisconsin for two decades. The three-year average rate was 18.4 per 1,000 live births in 1984-1986, declined to a low of 14.5 per 1,000 live births in 1992-1994, but increased again to 16.5 in 2003-2005.
- The Hispanic infant mortality rate fluctuated but remained essentially unchanged; it was 6.4 per 1,000 live births in 1984-1986 and 6.2 per 1,000 in 2003-2005.
- Total infant mortality and white infant mortality declined gradually over the 1984-2005 period, to 6.4 and 5.1, respectively.

Figure 22. Infant Mortality Rates by Race/Ethnicity, Three-Year Rolling Averages, 1984-2005

Source: Resident birth certificates, matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: An infant death is one that occurs before one year of age. The infant death rate is the number of resident infant deaths divided by total resident live births times 1,000. For detailed information on 2005 infant, neonatal and fetal deaths, see Table 4-8, pages 100-101. Total includes all infant deaths, including Asian and "Other," too small to be shown separately.

- The disparity ratio between the black infant mortality rate and the white infant mortality rate increased dramatically from the 1990-1992 period (2.2) to the 2003-2005 period (3.2). The disparity ratio is the black rate divided by the white rate, and is one measure of the difference in magnitude between the two rates.
- In contrast, the disparity ratio between the black low birthweight rate and the white low birthweight rate gradually decreased over the 15-year period. It was 2.0 in 2003-2005.
- The disparity ratio between the black very low birthweight rate and the white very low birthweight rate decreased during the 1990's, but has increased since 2000, to 3.4 in 2003-2005.

Figure 23. Black/White Disparity Ratio for Infant Mortality, Low Birthweight and Very Low Birthweight, Three-Year Rolling Averages, 1990-2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The disparity ratio is the black rate divided by the white rate.

Causes of Infant Death

- “Conditions originating in the perinatal period” accounted for 52 percent of infant deaths in 2005 (Figure 24). This category includes a variety of conditions that occur just before, during and after birth, such as pregnancy complications; complications of the placenta, cord and membranes; and unspecified prematurity and low birthweight (Figure 25).
- Congenital malformations, deformations and chromosomal anomalies accounted for 21 percent of infant deaths in 2005.
- Eight percent of infant deaths in 2005 were attributed to Sudden Infant Death Syndrome (SIDS).

Figure 24. Leading Causes of Infant Death, 2005

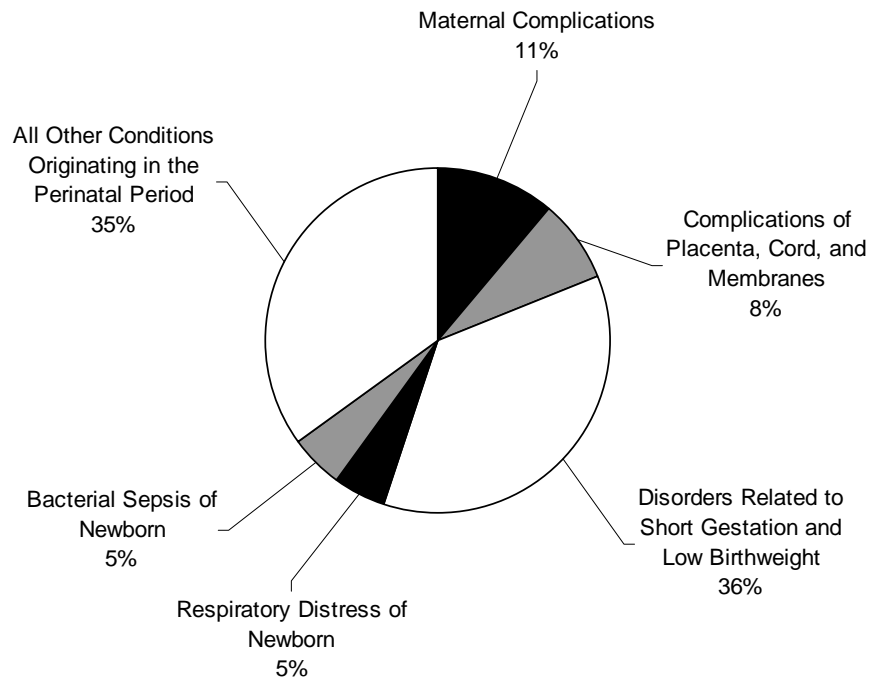

Source: Matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Beginning with 1999 data, causes of death have been coded using the International Classification of Diseases, Tenth Revision (ICD 10). This may affect comparability with previous years for some categories of death. See Technical Notes, page 106.

Percents in this figure are based on all infant deaths.

Figure 25. Causes of Infant Death: Conditions Originating in the Perinatal Period, 2005

Source: Matched birth-death file, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Beginning with 1999 data, causes of death have been coded using the International Classification of Diseases, Tenth Revision (ICD 10). This may affect comparability with previous years for some categories of death. See Technical Notes, page 106.

Percents in this figures are based on those infant deaths categorized as “conditions originating in the perinatal period.”

Table 2-1. Population, Births by Sex, Crude and General Fertility Rates by County of Residence, Wisconsin 2005

County	Population Estimate	Total Births	Male	Female	Crude Birth Rate	General Fertility Rate

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: The crude birth rate is the number of resident live births divided by the resident population times 1,000. The general fertility rate is the number of resident live births divided by the number of females ages 15-44 times 1,000. Population estimates are from the United States Census Bureau and the Wisconsin Department of Administration, Demographic Services Center. These estimates are provisional and subject to revision.

Note: Number shown includes all births that occurred at the hospital, including births to women who were not Wisconsin residents.

In Vernon County, 64 deliveries took place at the LaFarge Clinic; these births are not included in either the hospital or the home birth totals shown. In Dane County, 50 deliveries took place at the Madison Birth Center, SC, these births are not included in either the hospital or home birth totals shown. Almost all births (69,803 or 98 percent) occurred in hospitals.

Notes: This table shows the number of Wisconsin resident births in 2005 that occurred at home by the county in which the birth occurred. (The county in which the home birth occurred is not always the residence of the mother.) In Vernon County, 64 deliveries took place at the LaFarge Clinic; these births are not included in either the hospital or the home birth totals shown. In Dane County, 50 deliveries took place at the Madison Birth Center, SC, these births are not included in either the hospital or home birth totals shown. Almost all births (69,803 or 98 percent) occurred in hospitals. A dash (-) indicates there were no home births in that county.

Source: Fetal death and matched birth-death files, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Note: The fetal death rate is based on the number of fetal deaths per 1,000 live births and reported fetal deaths. The neonatal death rate is based on the number of neonatal deaths per 1,000 live births. The infant death rate is based on the number of infant deaths per 1,000 live births. Rates based on fewer than 20 deaths are omitted because they are subject to large random fluctuations.

Table 2-31. Fetal, Neonatal, Postneonatal and Infant Deaths by Selected Places, Wisconsin 2005

City of Residence	Fetal Deaths (Gestation \geq20 weeks)	Neonatal Deaths (Age <28 days)	+ Postneonatal Deaths (Age 28 days to 1 year)	= Infant Deaths (Age < 1 year)

Note: A dash (-) indicates that there were no events in that category. This table includes cities, townships (T) and villages (V) with a population of 20,000 or more according to population estimates from the United States Census Bureau and the Wisconsin Department of Administration, Demographic Services Center. These population estimates are provisional and subject to revision. Combined areas include: Mequon (C) with Thiensville (V); and Neenah (C) with Menasha (C).

Notes: In Wisconsin counties close to the Michigan border, births for 1990 are underreported to an unknown extent since Michigan did not report Wisconsin resident births for that year. In particular, all 1990 births among Florence County residents occurred in Michigan. Numbers of births for 1996 reported here are slightly different from those published in the 1996 report because other states filed 74 duplicate records for Wisconsin residents. The 2004 births total has been corrected (see note, Figure 1). A dash (-) indicates there were no births in that category.

Table 3-2. Number and Rate of Births by Age of Mother, Wisconsin 1985-2005

* Percentages are based on total live births.

** Rates are per 1,000 live births.

Notes: "Premature" means less than 37 weeks of gestation. Since 1980, gestational age has been calculated as the difference between the date of last normal menses and the date of delivery. Since 1993, clinical estimate of gestation has been substituted when date of last normal menses is unknown. In 2004 if the date of last normal menses was unknown or invalid or the computed estimate of gestational age was less than 16 weeks or greater than 45 weeks, the clinical estimate of gestation is substituted. Data for 1989-2003 shown on this page were recalculated to make them comparable with data for subsequent years, and differ from previously published data. (See Figure 19, page 27.) Caution is advised in making comparisons between data for 1989-2005 and data for the years before 1989.

See Technical Notes (page 105) regarding comparability of data on congenital anomalies since 1989.

Notes: Included in the totals are 30 births for which race/ethnicity of mother was not reported. A dash (-) indicates that there were no births in that category. "Premature" means less than 37 weeks of gestation. Gestational age is calculated as the difference between the date of last normal menses and the date of delivery. Where date of last normal menses is unknown or invalid, i.e., less than 16 weeks or greater than 45 weeks, clinical estimate of gestation is substituted.

Notes: Included in the totals are 12 births for which birthweight was not reported. Infants weighing less than 2,500 grams (or 5.5 pounds) at birth are considered low birthweight. Infants weighing less than 1,500 grams (or 3.3 pounds) at birth are considered very low birthweight. A dash (-) indicates that there were no births in that category.

Note: In the totals there are 6 births with gestational age less than 17 weeks. Estimated gestational age in weeks is calculated using the date of last normal menses and the date of delivery. Where date of last normal menses is unknown or invalid, i.e., less than 16 weeks or greater than 45 weeks, clinical estimate of gestational age is substituted.

Source: Fetal death and matched birth-death files, Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: The fetal death rate is based on the number of fetal deaths per 1,000 live births and reported fetal deaths. The neonatal death rate is based on the number of neonatal deaths per 1,000 live births. The infant death rate is based on the number of infant deaths per 1,000 live births. Rates based on fewer than 20 deaths are omitted because they are subject to large random fluctuations.

Table 4-9. Selected Birth Rates, Mortality Rates, and Birth Characteristics, Wisconsin 2005 and United States, 2003

Birth Rates	Wisconsin		United States
	Rate		Rate
Crude Birth Rate (births per 1,000 total population)	12.7		14.1
General Fertility Rate (births per 1,000 females ages 15-44)	61.2		66.1
Teen Birth Rate (births per 1,000 females ages 15-19)	30.5	30.1*	41.6
Mortality Rates			
Infant Mortality Rate (infant deaths per 1,000 live births)	6.6		6.8
Infant Mortality Rate – Black Non-Hispanic	15.0		13.6
Infant Mortality Rate – White Non-Hispanic	5.6		5.7
Neonatal Mortality Rate (deaths <28 days of age per 1,000 live births)	4.5		4.6
Perinatal Mortality Rate (fetal deaths and deaths <28 days of age per 1,000 live births and fetal deaths)	11.7	6.5**	6.9***
Birth Characteristics			
	Percent		Percent
Mother Unmarried	32.8%		34.6%
First-Trimester Prenatal Care	85.0		84.1
Late or No Prenatal Care	2.9		3.5
Maternal Smoking	13.4		10.7
C-Section Delivery	23.7		27.5
Birth Order 4+	11.3		10.8
Low Birthweight	7.0		7.9
Low Birthweight – Black Non-Hispanic	13.7		13.6
Low Birthweight – White Non-Hispanic	6.3%		7.0%

* This Wisconsin rate is calculated to be comparable to the U.S. rate, which excludes mothers younger than 15.

** This Wisconsin rate is calculated to be comparable to the U.S. rate, which includes the number of late fetal deaths (greater than or equal to 28 weeks of gestation) plus infant deaths within seven days of birth per 1,000 live births plus late fetal deaths.

*** Rate for 2002, the latest available data. The US perinatal mortality rate is cited from Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System: Hoyert DL, Heron M, Murphy SL, Kung HC. Health, United States, 2005 With Chartbook on Trends in the Health of Americans. Hyattsville, Maryland: 2006.

Map 1. Wisconsin Department of Health and Family Services Regions, 2005

Source: Bureau of Health Information and Policy, Division of Public Health, Department of Health and Family Services.

Notes: Vernon County was reassigned from the Western to the Southern Region effective February 2004. This change is reflected in the data presented for 2003 and subsequent years. Comparisons with regional data in previous publications may be affected.

Note: See Technical Notes (page 107) for explanation of Perinatal Regions.

Sources, Definitions, and Explanations of Terms

National Data. Unless otherwise noted, national data used in this report were cited from Martin JA, Hamilton BE, Sutton PD, et al. Births: Final data for 2003. *National Vital Statistics Reports*, Vol. 54, No. 2. Hyattsville, Maryland: National Center for Health Statistics, 2005. National infant mortality data are drawn from Mathews TJ, MacDorman MF. Infant mortality statistics from the 2003 period linked birth/infant death data set. *National Vital Statistics Reports*, Vol. 54, No. 6. Hyattsville, Maryland: National Center for Health Statistics, 2006.

Race/Ethnicity Classifications. All live births, fetal deaths and infant deaths were classified by race or Hispanic origin of mother into one of six categories : non-Hispanic white, non-Hispanic black/African American, non-Hispanic American Indian, Hispanic/Latino, non-Hispanic Laotian/Hmong, and non-Hispanic other (which are almost entirely Asian). The Laotian/Hmong category consists of mothers whose race was indicated as “Laotian” or “Hmong” and mothers born in Laos. Hispanics/Latinos may be of any race.

Prior to 1994, Wisconsin birth reports included a race/ethnicity category labeled “Indochinese.” Beginning in 1994, this category was redefined as “Laotian/Hmong” (constituting approximately 95 percent of the Indochinese category). The remaining 5 percent of births in the Indochinese category were reallocated to the “Other” grouping; this includes Vietnamese, Cambodian, Thai, Chinese, Japanese, and East Indian.

The Asian category used in birth rates by race calculations is made up of Chinese, Japanese, Filipino, Other Asian/Pacific Islander, Laotian, Vietnamese, Korean, Cambodian, and Hmong.

Birth Certificate Checklists. Beginning in 1989, data on maternal health, pregnancy, delivery, and some dimensions of birth outcomes were collected in the following birth certificate checklists: “Medical history for this pregnancy,” “Obstetric procedures,” “Events of labor and/or delivery,” “Method of delivery,” “Abnormal conditions of the newborn,” and “Congenital anomalies of child.” These data were previously collected in a fill-in-the-blank format. Thus, data presented in annual reports for 1982-1988 on risk and treatment (“Type of delivery,” “Concurrent conditions of pregnancy,” “Complications of pregnancy,” “Complications of delivery,” and “Congenital anomalies”) are not comparable to the data presented in annual reports since 1989 (*Maternal and Child Health Statistics* and *Wisconsin Births and Infant Deaths*).

Also to be noted are the limitations on comparability that relate to changes in the editing of the medical checklist items since 1989. Each checklist (with the exception of “Method of delivery”) has an “other-specify” checkbox. Conditions reported in the “other-specify” category have been edited to exclude invalid reports from the database, and to ensure that those conditions that belong elsewhere in a checklist are properly reported. The editing process has varied each year, which affects comparability. This most affects data on “Medical history for this pregnancy” and “Congenital anomalies of child;” it also affects comparability of “Events of labor and/or delivery” and “Abnormal conditions of the newborn.” In 1990, this editing was done only for the “Congenital anomalies” and “Abnormal conditions” checklists. Since 1990, edits have been expanded to include “Medical history for this pregnancy,” “Obstetric procedures,” and “Events of labor and/or delivery.”

Definitions of “Medical risk factors for this pregnancy,” “Obstetric procedures,” “Complications of labor and/or delivery,” “Abnormal conditions of the newborn” and “Congenital anomalies of child” were adapted from:

National Center for Health Statistics. A dvance report of new data from the 1989 birth certificate. *Monthly Vital Statistics Report*; Vol. 40, No. 12, Supplement. Hyattsville, Maryland: Public Health Service, 1997.

Prematurity. Births were classified as premature (less than full term) if the gestational age was less than 37 weeks. To determine gestational age, a prematurity index is used; this is usually based on the computed estimate of gestational age, which is the difference between the date of last normal menses and the date of the infant’s birth. The clinical estimate of gestational age (reported by the physician directly on the birth certificate) is substituted when the date of last normal menses is unknown or invalid or the computed estimate of gestational age is less than 16 weeks or greater than 45 weeks. The use of this index decreases the number of unknown records on gestational age.

Mortality.

Infant Deaths. The birth-death cohort is not completed until one full year after the end of the birth cohort calendar year. This publication reports mortality data on infants who died during 2005, rather than the mortality experience of the 2005 birth cohort, to allow more timely reporting on infant mortality.

Causes of Death. Causes of death in this report have been coded according to the International Classification of Diseases (ICD), Tenth Edition. Before the 1999 data year, causes of death were coded according to the ICD, Ninth Edition. This change does not affect comparability between years for four of the five leading causes of infant death shown in this report (Conditions Originating in the Perinatal Period; Congenital Malformations, Deformations and Chromosomal Anomalies; Sudden Infant Death Syndrome or SIDS; and Accidents – see Pages 32 and 33).

Fetal Deaths. A fetal death or stillbirth is “a fetus which, after complete expulsion or extraction from the woman, does not breathe or show other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles.” By Wisconsin statute, a stillbirth of at least 20 weeks’ gestation or 350 grams must be reported. (Note: A fetal death report is not used for induced terminations of pregnancy (induced abortions)). Some stillbirths (fetal deaths) to Wisconsin residents are not included in this publication because some were less than 20 weeks’ gestation, some occurred outside Wisconsin, and an unknown number that occurred within the state were not reported.

Perinatal Deaths. Includes all reported fetal deaths of 20 or more weeks of gestation and all neonatal deaths (deaths of liveborn infants occurring before 28 days of age).

Maternal Deaths. There were fifteen deaths in 2005 for which a maternal cause of death was reported on the death certificate. Before 1989, and beginning again in 1994, the Wisconsin Center for Health Statistics (now the Bureau of Health Information and Policy) followed up deaths of women of childbearing age with inquiries about pregnancy-related causes of death. Maternal deaths from 1989-1993 may be underreported because this special study was not conducted for those years. Beginning in 2003, an item was added to the Wisconsin death certificate that allows the medical certifier to specify the pregnancy status of the decedent. This should improve ascertainment of maternal deaths from death certificate records.

Perinatal Regions. These tables present birth information for each of the seven Perinatal Regions in Wisconsin (see Map 2, page 104). These regions were informally designated in the early 1970s by the Wisconsin Association for Perinatal Care, in cooperation with organizations representing public and private providers of perinatal services. Perinatal regions represent geographical boundaries within which arrangements exist among providers of perinatal services to facilitate optimal treatment for pregnant women and newborns. Within each region, selected hospitals with the capability to provide neonatal and maternal intensive care have been self-designated as perinatal centers. High-risk pregnancies and deliveries are often referred to or transported to these perinatal centers, as are high-risk babies born outside perinatal centers. Health care providers within the regions also collaborate in other ways to address perinatal health care issues as they arise.

Limitations of the Data. Vital records information has some limitations related to completeness, accuracy, and timeliness of registration, quality control procedures and classification problems. The reporting of live births and infant deaths is considered to be essentially complete for births occurring in Wisconsin. A cooperative exchange program between all states has been in operation for several decades to allocate birth and death certificates to the state of residence. Although this exchange program is not totally complete, the incompleteness is not of sufficient magnitude to seriously affect statistics on natality and infant mortality.

Edit checks are incorporated in the software used for electronic transmission of birth certificate data, and the Vital Records Registration and Statistics Unit in the Bureau of Health Information and Policy reviews birth certificates and death certificates for logical inconsistencies. Some errors remain after this review, but they are thought to have little, if any, effect on statistical results.

There may be some underreporting of medical risk factors and types of obstetrical procedures performed. There may also be underreporting of congenital anomalies which are identifiable at birth; in addition, some congenital anomalies cannot be detected at the time the birth certificate is filed.

Medical Risk Factors for This Pregnancy: Definitions

<i>Anemia</i>	Maternal hemoglobin level of less than 10.0 g/dL during pregnancy, or a hematocrit of less than 30 percent during pregnancy.
<i>Cardiac Disease</i>	Disease of the heart.
<i>Acute or Chronic Lung Disease</i>	Disease of the lungs during pregnancy.
<i>Diabetes</i>	Metabolic disorder characterized by excessive discharge of urine and persistent thirst; includes juvenile onset, adult onset, and gestational diabetes during pregnancy.
<i>Genital Herpes</i>	Infection of the skin of the genital area by herpes simplex virus.
<i>Hydramnios/ Oligohydramnios</i>	Any noticeable excess (hydramnios) or lack (oligohydramnios) of amniotic fluid.
<i>Hypertension, Chronic</i>	Blood pressure persistently greater than 140/90, diagnosed prior to onset of pregnancy or before the 20 th week of gestation.

<i>Hypertension, Pregnancy-Associated</i>	An increase in blood pressure of at least 30 mm Hg systolic or 15 mm Hg diastolic on two measurements taken six hours apart after the 20th week of gestation.
<i>Eclampsia</i>	The occurrence of convulsions and/or coma unrelated to other cerebral conditions in women with signs and symptoms of preeclampsia.
<i>Incompetent Cervix</i>	A condition characterized by painless dilation of the cervix in the second trimester or early in the third trimester of pregnancy, with premature expulsion of membranes through the cervix and ballooning of the membranes into the vagina, followed by rupture of the membranes and subsequent expulsion of the fetus.
<i>Previous Infant 4,000+ Grams</i>	Previous birth of a live-born child with a birthweight of over 4,000 grams (8 lbs., 14 oz.).
<i>Previous Preterm or SGA Infant</i>	Previous birth of an infant prior to term (before 37 completed weeks of gestation), or of an infant weighing less than the 10th percentile for gestational age, using a standard weight-for-age chart. (SGA means “small for gestational age.”)
<i>Renal Disease</i>	Kidney disease.
<i>Rh Sensitization</i>	The process or state of becoming sensitized to the Rh blood factor, as when an Rh-negative woman is pregnant with an Rh-positive fetus.
<i>Uterine Bleeding</i>	Any clinically significant bleeding during the pregnancy, taking into consideration the stage of pregnancy; any second- or third-trimester bleeding of the uterus prior to the onset of labor.

Obstetric Procedures: Definitions

<i>Amniocentesis</i>	Surgical transabdominal perforation of the uterus to obtain amniotic fluid to be used in the detection of genetic disorders, fetal abnormalities, and fetal lung maturity.
<i>Electronic Fetal Monitoring</i>	Monitoring with external devices applied to the maternal abdomen or with internal devices with an electrode attached to the fetal scalp and a catheter through the cervix into the uterus, to detect and record fetal heart tones and uterine contractions.
<i>Induction of Labor</i>	The initiation of uterine contractions before the spontaneous onset of labor by medical and/or surgical means for the purpose of delivery.
<i>Stimulation of Labor</i>	Augmentation of previously established labor by use of oxytocin.
<i>Tocolysis</i>	Use of medications to inhibit preterm uterine contractions to extend the length of pregnancy and, therefore, avoid a preterm birth.
<i>Ultrasound</i>	Visualization of the fetus and the placenta by means of sound waves.

Congenital Anomalies: Definitions

<i>Anencephalus</i>	Absence of the cerebral hemispheres.
<i>Spina Bifida/ Meningocele</i>	Developmental anomaly characterized by defective closure of the bony encasement of the spinal cord, through which the cord and meninges may or may not protrude.
<i>Hydrocephalus</i>	Excessive accumulation of cerebrospinal fluid within the ventricles of the brain with consequent enlargement of the cranium.
<i>Microcephalus</i>	A significantly small head.
<i>Other Central Nervous System</i>	Other specified anomalies of the brain, spinal cord, and nervous system.
<i>Heart Malformations</i>	Congenital anomalies of the heart.
<i>Other Circulatory/ Respiratory</i>	Other specified anomalies of the circulatory and respiratory systems.
<i>Rectal Atresia/ Stenosis</i>	Congenital absence, closure, or narrowing of the rectum.
<i>Tracheo-Esophageal Fistula/Esophageal Atresia</i>	An abnormal passage between the trachea and the esophagus; esophageal atresia is the congenital absence or closure of the esophagus.
<i>Omphalocele/ Gastroschisis</i>	An omphalocele is a protrusion of variable amounts of abdominal viscera from a midline defect at the base of the umbilicus. In gastroschisis, the abdominal viscera protrude through an abdominal wall defect, usually on the right side of the umbilical cord insertion.
<i>Other Gastrointestinal</i>	Other specified congenital anomalies of the gastrointestinal system.
<i>Malformed Genitalia</i>	Congenital anomalies of the reproductive organs.
<i>Renal Agenesis</i>	One or both kidneys are completely absent.
<i>Other Urogenital</i>	Other specified congenital anomalies of the organs concerned in the production and excretion of urine, together with organs of reproduction.
<i>Cleft Lip/Palate</i>	Cleft lip is a fissure or elongated opening of the lip; cleft palate is a fissure in the roof of the mouth. These are failures of embryonic development.
<i>Polydactyly/Syndactyly, Adactyly</i>	Polydactyly is the presence of more than five digits on either hands and/or feet; syndactyly is having fused or webbed fingers and/or toes; adactyly is the absence of fingers and/or toes.

<i>Clubfoot</i>	Deformity of the foot, which is twisted out of shape or position.
<i>Diaphragmatic Hernia</i>	Herniation of the abdominal contents through the diaphragm into the thoracic cavity, usually resulting in respiratory distress.
<i>Other Musculo-Skeletal/ Integumental</i>	Other specified congenital anomalies of the muscles, skeleton, or skin.
<i>Down Syndrome</i>	The most common chromosomal defect, with most cases resulting from an extra chromosome (trisomy 21).
<i>Other Chromosomal</i>	All other chromosomal aberrations.
