

TYPE 2 DIABETES: AMBULATORY GLYCEMIC CONTROL PATHWAY

Footnotes:

- See tools "Diabetes Mellitus Medications 2012" and "Insulin Therapy 2012" for specific dosing information
- Some agents mainly affect basal hyperglycemia, others target post-prandial hypoglycemia. Control of basal hyperglycemia is usually the first task.
- Check A1C three months after titration to maximize effective dose
- Increased risk of hypoglycemia if A1C is < 7.5%
- If using < 30 units of basal insulin, will likely be able to titrate off insulin

Disclaimer: Throughout therapy use, assess for frequency, severity, and unexplained episodes of hypoglycemia.
