CDC Vaccination Guidance During a Pandemic

Additional Considerations for Influenza Vaccination

Annual influenza vaccination is recommended for all persons aged 6 months and older to decrease morbidity and mortality caused by influenza. Healthcare providers should consult current influenza season’s recommendations for the CDC’s influenza vaccine update for specific guidance.

During the COVID-19 pandemic, reducing the overall burden of respiratory diseases is important to protect susceptible populations at risk for severe illness, the healthcare system, and clinical institutions. Yet, healthcare providers should seize every opportunity during the influenza vaccination season to administer influenza vaccine to eligible persons, including:

- Essential seniors healthcare personnel, including nursing home, long-term care facility, and pharmacy staff, and other critical infrastructure workforce.
- Persons with pre-existing conditions like chronic heart disease, hypertension, chronic lung disease, chronic kidney disease, obesity, neural system disease, diabetes, and pregnancy.
- Persons under 65 years of age with reduced immunity to common infections, including adults age 65 years and older, children with neurologic conditions, program wavers, adults age 65 years and older, and other persons with chronic medical conditions.
